Referring to conferences with you relative to extension Aerial Mail Service to Colorado points, I have directed the extension immediately after the war of Aerial Mail Service to Denver in connection with the transcontinental route from New York to San Francisco.

Mr. Burleson has announced that the New York-Chicago air mail route will start some time before Dec. 15, the exact date depending upon the receipt of necessary airplanes. Work is in progress on the hangars at Woodland Hills Park, Cleveland; Bryan, Ohio, and at Clarion, Bellefonte and Lehigh, Pa. The hangars will be ready for use Dec. 1. The winter plan of operation is for trips from Chicago and New York, starting at 6 a. m. and including all stops to be made within 10 hours. It is expected that approximately 20,000 letters will be carried daily.

Preparations have been made to insure successful service through the winter months. Electrically-heated clothing for the pilots and individual heating plants for each plane form a part of the program. The heating plants will keep the engines warm in the hangars through the coldest weather and allow immediate starting. Landing and take-off areas will be well packed during snow time and equipment has been devised for the control of planes on sleet and ice. The New York-Chicago airplanes will be equipped with wireless.

That the service has proven efficient up to this time was stated recently in a

public announcement issued by the department, adding further that it has proven the possibility of further extension and the value of the saving in time which may be accomplished by the use of the airplane for the transportation of mail, the benefit being in accumulating ratio as the distance covered is increased. In future extensions, when war conditions permit of this, there will be nothing experimental. That the Air Mail Service has progressed beyond the state of experiment is shown by the following figures:

During August there were 27 flying days, 108 legs of journey being made. In making these 108 flights there were only two forced landings, one causing a delay of 17 min., the other of 10 min. Of the total mileage to be flown, 11,961 miles, 11,957 were actually completed.

The record for the month of September and for October was 100 per cent perfect, according to the Post Office Department.

The Post Office appropriation bill passed by Congress permits the War Department to turn over the airplanes to the Post Office as requisitioned and without charge, and it is expected that a large number of planes and considerable equipment will be turned over to the postal authorities, and that the \$1,500,000 appropriation will be used exclusively for maintenance cost.

### Naval Pilots Use Parachutes

WASHINGTON, Nov. 29—Two Naval aviators dropped from more than 3000 ft. from swiftly moving seaplanes flying over this city yesterday by means of parachutes and made successful landings. Ten minutes were consumed in the descent.

### A Three-Stop Transcontinental Air Service Predicted

WASHINGTON, Dec. 2—From New York to San Francisco by air with three stops, Chicago, Denver and Salt Lake City, will be a commonplace flight soon.

That non-stop air mail service between Chicago and New York is not only a possibility but a certainty was demonstrated last week, when non-stop flights, Dayton to New York, 550 miles, consuming one-half of the gasoline supply, and Mt. Clemens, Mich., to New York City without use of the extra gasoline supply, proved conclusively that the post office plan of service between New York and Chicago is a sane one, and that the present scheme which contemplates landing places between these points is particularly conservative. The DeHavilland-4 Army planes have displayed their ability to make 850-mile flights without stopping.

In fact, judging by the numerous non-stop records announced, it is a safe prediction that mail from New York to San Francisco by air with three stops, at Chicago, Denver and Salt Lake City, will be a regular occurrence before 1920.

## Plan 21 Naval Aerial Stations

Coastal Patrol Would Include 4 Zeppelins, 12 Dirigibles and 144 Smaller Balloons

WASHINGTON, Nov. 29—The establishment of a coastal air patrol to include four Zeppelin-type airships, twelve dirigibles and 144 smaller balloons was discussed by naval officers before the House Naval Affairs Committee to-day. The Navy intends to pay \$1,500,000 each for the Zeppelin-type of airships. The dirigibles will cost \$250,000 each and the smaller balloons \$75,000 each. The Navy will also buy 108 fighting escort planes.

During the discussion it was said that \$90,000,000 of the \$220,000,000 appropriated for Naval aviation will be returned to the Treasury in July, 1919, as "unnecessary." Rear-Admiral Taylor, Chief of Naval Construction, described the work of the Zeppelins, telling that during the war one of these airships flew from Germany to German East Africa.

### Navy Asks Aid from Congress

The Navy urgently requests the aid of Congress in the establishment of aerial coastal defenses. Officers testify that with proper defense the U boats which appeared off the American shores last year would have been unable to do any damage and would probably have been destroyed.

The discovery of a non-inflammable balloon gas was announced and pronounced so efficient that it could be fired into the gas bag without igniting. The gas costs more than hydrogen but leaks less rapidly, thus evening up the final cost.

Twenty-one aerial stations are planned, some of which are under construction. They will command the Gulf, Pacific and Atlantic coasts and insular possessions, and will be established on the Maine coast near Portland, Narragansett Bay, New York harbor, Port Arthur, Texas; San Francisco; Seward, Alaska; Guam and St. Thomas, West Indies; Hawaii and the Panama Canal Zone. Stations under construction are at Camp Lookout, N. C.; Brunswick, Ga.; Galveston, Texas. Completed stations are at Chatham, Mass.; Rockaway Beach, N. Y.; Key West, Fla.; Miami, Fla.; San Diego, Cal.

### Plane Capable of 160 M.P.H.

Further discussion by Admiral Taylor confirmed the reports current in Washington of a plane capable of 160 m.p.h. Admiral Taylor told that experiments with a Kirkham triplane had resulted in the speed of 160 m.p.h. It is reported here that this plane has been developed by the Curtiss Engineering Co.

It is also stated that \$36,000,000 worth of contracts for Naval airplane service have been canceled since the armistice was signed.

## Non-Stop Flight Records Broken

### A Standard De Haviland-4 Plane with Liberty 12 En- gine Travels 550 Miles

WASHINGTON, Dec. 2—Making a dinner and theater engagement in New York City at 10 a. m. from Dayton, and arriving to keep the engagement for the same day, was what C. F. Kettering, vice-president of the Dayton-Wright Airplane Co., and H. M. Rinehart, premier pilot of that company, accomplished late last week, at the same time breaking all non-stop airplane flight records in the United States. The trip was made in a standard DeHaviland-4 plane equipped with a Liberty 12 engine, and the journey of 550 miles was accomplished in 4 hr. 10 min., an average of 134 m.p.h. When Mineola, Long Island, was reached there was enough oil and gasoline in the tanks to carry the machine back to Dayton, and Mr. Rinehart thought a 1000-mile non-stop journey with a DeHaviland-4 should be a comparatively simple matter.

#### Leaves Dayton 11 A. M.

The journey was made leaving Dayton at 11 a. m. Saturday, just following receipt of orders to bring a DeHaviland-4 plane to Washington. Mr. Kettering, who was desirous of going to New York, suggested that the journey be made via New York, stopping there for dinner and a show, and then going on to Washington. At exactly 11 a. m. the machine arose in the air. At 3.10 p. m. it landed on Mineola Field. The aviators kept their dinner and theater engagement. At 2.05 p. m. yesterday afternoon the fliers started for Washington. At 4.10 they stepped from their plane in front of the hangars on Bolling Field, covering the distance of 224 miles in 2 hr. 5 min.

Mr. Rinehart stated that on the trip from Dayton to New York and New York to Washington an altitude of 5000 ft. was maintained, and at no time did he go more than 5 miles off the air line course.

#### Seaplane Carries 50 Passengers

WASHINGTON, Dec. 2—All records for carrying a large number of passengers in any type of airplane were broken Wednesday, Nov. 27, at the Naval Air Station, Rockaway, when the Navy's newest type of seaplane, the giant NC-1, the largest seaplane in the world, made a flight with 50 men on board. Most of the men were accommodated in the large boat body.

The design and the construction of the NC-1, with its triple motors, huge size and other distinctive features, was carried out by the Navy in co-operation with the Curtiss Engineering Corp. It is not specifically a flying boat nor is it of the pontoon variety of seaplane, but combines the most valuable advantages of

both, its size and purpose being considered. While it is entirely new and original in type, the NC-1 incorporates proven essentials in aircraft construction, and even before it was tested was regarded in naval circles as a pre-insured success rather than as an experiment.

This is the first American tri-motored seaplane, being propelled by 3 Liberty motors that develop a maximum of 1200 hp., giving it a cruising speed of 80 m.p.h. The flying weight of the machine is 22,000 lb., while the weight of the seaplane itself, unloaded and without a crew, is 13,000 lb.

An idea of the size of the big seaplane is shown by the fact that the wing spread is 126 ft., the breadth of wing 12 ft., and the gap between wings 12 ft.

Recently the NC-1 made the trip from Rockaway to Washington, about 350 miles, in 5 hours and 20 minutes. The flight from Washington to Hampton Roads, 150 miles, was covered in 2 hours and 15 minutes, and the trip from Hampton Roads to New York, 300 miles, took 4 hours and 20 minutes.

#### Praises John D. Ryan

WASHINGTON, Nov. 29—That the aircraft program had already succeeded when Howard Coffin resigned and John D. Ryan was appointed as head of the Air Service was indicated in correspondence between President Wilson and Mr. Ryan, in which the latter was thanked for his service and for the management which speedily established the public confidence. The President's letter recognized Mr. Ryan's desire to return to industrial work and added:

The aircraft program was in all likelihood proceeding toward success but the energy of your management and the broad business experience which you brought into the Air Service speedily established the whole thing in the public confidence and gave the country full assurance that our participation in the war through the Air Service would be in keeping with our responsibilities and resources.

#### Department of Labor Reorganized

WASHINGTON, Nov. 29—The Department of Labor will be reorganized from a war to a peace basis by a committee appointed by Secretary of Labor Wilson, and including Louis F. Post, Assistant Secretary of Labor, chairman; A. W. Parker, Bureau of Immigration; Roger W. Babson, Director of the Education Service; Mary Van Kleeck, Director of the Woman Industries Service, and Grant Hamilton, Director of the Working Conditions Service. The department now has two services and eight boards created during the war, and the committee will decide upon the conversion of some of the boards and the elimination of others. Those to be converted, as for example the United States Employment Service, which has 900 branch offices and 4400 employees, will probably be expanded to meet the exigencies arising from demobilization.

## Australia in Need of Farm Tractors

### Much Interest Displayed in First Official Field Trials at Melbourne

SYDNEY, N. S. W., Oct. 12—S. L. Tyler, a director of McIntosh & Sons, Ltd., Buick distributors, states that the demand for farm tractors is increasing rapidly, and that the first field trials held under the auspices of the Federal Government were carried out so successfully that interest was greatly stimulated as to the possibilities offered by power farming.

Experiments are being conducted with a suction gas generator designed to eliminate the use of gasoline as a fuel. These have proved satisfactory, according to Mr. Tyler.

Whether the passenger car dealer will handle the farm tractor or not seems to be a point under consideration, as in Australia it has been found that a dealer cannot, as a rule, sell both cars and trucks satisfactorily. In the case of the larger firms, such as McIntosh & Sons, it is likely that subsidiary companies will be formed for the express purpose of handling tractors.

The Commonwealth of Australia is a very large grower of wheat and other grain, and improved shipping conditions are practically certain to further increase production.

#### Will Market Liberty Fuel Jan. 1

WASHINGTON, Dec. 2—The new motor power called Liberty fuel will be sold to the general public by Jan. 1, according to a new announcement by Capt. E. C. Weisgerber, the inventor. The base of the new fuel is said to be kerosene. The invention has been patented and according to the regulations of the War Department the inventor may make it a commodity for public use. Three thousand gallons are reported to have been manufactured to date, this amount being used largely for experimental purposes. It is said that the new motor gas is composed of 80 per cent kerosene, the balance being chemicals that constitute the essentials of the discovery.

The price of the new fuel has not been fixed, but it is stated that the ingredients other than kerosene are of low cost and can be obtained readily.

#### Makes 500-Mile Non-Stop Flight

WASHINGTON, Dec. 2—Major N. J. Boots, Army pilot, made a non-stop flight of 500 miles from Mt. Clemens, Mich., to New York City last week in 4 hours and 30 minutes. He used a Fisher Body Co. DeHaviland 4 with a Liberty engine and one extra 25-gal. gasoline tank. An altitude of 8000 ft. was reached between Buffalo and New York City. The supply of gasoline in the extra tank was not used.

## Export Product List Revised

### Tires and All Manufactured Rubber Articles Can Be Shipped; Not Crude Rubber

WASHINGTON, Nov. 29—All manufactured rubber articles, including automobile tires, have been removed from the export conservation list and can now be shipped to all destinations. Crude rubber cannot be exported from this country. Numerous other commodities are removed from the list and can be exported generally. These include the following:

Alloys containing tin.  
Anti-friction metal, bars and pigs and all shapes, unless an integral part of a complete machine.  
Babbitt metal, bars and pigs and all shapes, unless an integral part of a complete machine.  
Anti-friction bearings, unless an integral part of a complete machine.  
Babbitt bearings, unless an integral part of a complete machine.  
Bichloride of tin.  
Oil cans, second-hand crushed.  
Oil squirt cans.  
Chloride of tin.  
Founts, lamp, tin.  
Lamp founts, tin.  
Lanterns, tin.  
Anti-friction metals.  
Babbitt metals.  
Type metals.  
White metals.  
Oxide of tin.  
Phosphorized tin.  
Any metallic alloy containing tin.  
Bichloride of tin.  
Bottle caps or covers of tin foil.  
Chloride of tin.  
Collapsible tubes.  
Cork corks.  
Compounds of tin.  
Crystals.  
Oxide.  
Salts.  
Silverware containing tin.  
Carbon Tetrachloride.  
Wire tin.  
Aeronautical instruments.  
Aeronautical machines, their parts and accessories.  
Anti-aircraft instruments, apparatus and accessories.  
Boring machines, horizontal and vertical.  
All iron and steel chains, either welded, case or stamped.  
Chronometers.  
Chucks, drill.  
Chucks, lathe.  
Circular-saw blades.  
Engines, marine, and parts (individual licenses not required to Canada and Newfoundland for engines of 60 hp. and under).  
Machine tools, as follows:  
Grinders, internal, plain and universal.  
Horizontal and vertical boring machines.  
Lathes, all sizes.  
Milling machines, plain and universal (except hand millers).  
Planers.  
Radial drilling machines.  
Slotters.  
Vertical boring mills, all sizes.  
Machines as follows:  
Boring, horizontal and vertical.  
Milling, plain and universal (except hand millers).  
Drilling, radial.  
Micrometers.  
Presses, hydraulic.  
Pyrometers, equipment and thermocouples.  
Tachometers.  
Tools, as follows:  
Callipers, drill chucks, drills, files, abrasive (see Files), lathe chucks, micrometers, reamers, saw blades, circular, hack and band.  
Twist drills.  
Vertical boring machines.  
Vertical boring mills, all sizes.  
Alloy steel.  
Bars, iron and steel.  
Bars, iron and steel (including flats 6 in. wide and narrower).

Cable (iron and steel consisting of 6 wires or more).  
Casing, oil well (frequently described as "boring tubes").  
Cast-iron pipe.  
Fabricated structural steel, iron and steel, including angles, channels, beams, tees and zees, and plates  $\frac{1}{4}$  in. thick and heavier, punched or shaped, including tanks made of plates  $\frac{1}{4}$  in. thick and heavier.  
Boiler tubes.  
Sheets less than  $\frac{1}{4}$  in. thick.  
Tool steel.  
Wire.  
Formic acid.  
Hydrochloric acid.  
Muriatic acid.  
Chemical compounds of manganese.  
Chemical compounds of tungsten.

### American Farm Tractor Demonstrated in Uruguay

WASHINGTON, Dec. 3—A trial exhibition of an American tractor at Montevideo, Uruguay, reported by the American consul there as taking place early in October, attracted considerable attention in interested circles. The exhibition consisted in plowing to a depth of 4.7 and 7 in. and at a speed of from 2.5 to 3.1 m.p.h., harrowing and free running. It is estimated that the tractor can plow 10 acres in an 8-hr. day with a consumption of 5.8 gals. of kerosene per 2.471 acres. The make of tractor was not named in the report, which stated that it was offered for sale completely equipped in Uruguay for \$1,447.

### N. A. C. C. Confers with Dealers on Shows

NEW YORK, Dec. 5—At yesterday's meeting of the directors of National Automobile Chamber of Commerce a committee was appointed composed of C. C. Hanch, J. Walter Drake and S. A. Miles to confer with the representatives of the New York and Chicago automobile trade associations in connection with the local automobile shows which the dealers propose to hold in those cities early in 1919. Henry Paulman and G. M. Allison attended for the Chicago Automobile Trade Association, and Chas. H. Larsen, R. J. Gilmore and Chas. H. Stewart for the New York Dealers' Association. Announcement of the result of their deliberations is promised within two or three days.

### President Exonerates Vincent of Improper Intentions

WASHINGTON, Dec. 4Lt. Col. Jesse C. Vincent, one of the designers of the Liberty airplane engine and formerly vice-president of the Packard Motor Car Co. and George W. Mixter, both army officers named by Charles E. Hughes in his report on the aircraft investigation as having violated a code, have been found completely innocent of any intentional wrong doing by Attorney General Gregory, and his recommendation that they be pardoned has been acted upon by President Wilson, according to an announcement from the White House last night. Col. Vincent, it was said by Attorney General Gregory, "rendered invaluable service in designing and perfecting the Liberty engine." He acted in entire good faith and took no advantage of the Government, said Mr. Gregory.

## An Aerial Weather Forecast

### Bureau Issues First Report of Conditions in Co-operation with Mail Service

WASHINGTON, Dec. 3—The first aerial weather forecast to be issued in the history of the United States was made public last night by the Weather Bureau, in co-operation with the aerial mail service of the Post Office Department. The forecast marks a new phase of aviation. It is as follows:

"New York to Cleveland. Cloudy 8 p. m. Snow near Lake Erie. Winds moderate northwest to north-northwest east of the Alleghenies up to 6500 ft. and moderate south winds west of Alleghenies shifting to west-southwest at about 1500 ft. Forecast: Snow Monday, with increasing northeast to north winds up to about 6000 ft., backing to strong northwest above.

This forecast was wired to the Aerial Mail Field, Woodland Hills Park, Cleveland, and the intention is to extend the service as aerial mail routes are lengthened.

"The forecast," said Otto Praeger, Second Assistant Postmaster General in charge of aerial mail, "enables the department to lay its plans on a scientific basis and assures a greater degree of success than would otherwise be possible. The Weather Bureau undertook this new research on its own initiative. Dr. Charles F. Marvin, chief of the Weather Bureau, and a member of the National Advisory Committee for Aeronautics, saw while the war was on that it would be impossible to develop the airplane commercially in time of peace without meteorological guidance so as to overcome adverse conditions on long-distance flights. This forecast is the result."

### Plans Extension of Service

The Postoffice Department is rapidly completing its plans for an extension of the service so that on December 15 daily airplane mails will be run between New York and Chicago. Experiences demonstrates that this service can be operated with greater economy as the lines are extended, and so the department is able to announce, for the New York-Chicago service, a reduction in the rate of postage from 16 cents an ounce or fraction thereof to 6 cents. This applies to sealed parcels, not exceeding 30 inches in length and girth combined, as well as the letters. The old rate of 16 cents on the first ounce allowed 10 cents for special delivery service. Under the new rate it is left optional to the sender of a letter whether he desires to place a special delivery stamp on his aeroplane mail. This places the aeroplane rate on the same basis as all other letter mail.

On the New York-Chicago route all mail stops are made in ample time to catch the regular carrier delivery, insuring the delivery of the letter that day, and making it unnecessary to apply special delivery unless the sender desires immediate expedition of the letter upon its arrival in the city of address. Faster machines, beginning December 15, will also be placed on the New York-Washington route, insuring arrival of the mail for the regular carrier delivery in Washington and New York on the day of arrival.

Special aeroplane postage stamps or ordinary postage stamps may be used. When ordinary postage stamps are used the mail should be endorsed "By Aeroplane." If special delivery service is desired, a special delivery stamp or its equivalent in ordinary postage stamps must be placed on the mail in addition to the 6 cents air postage. If ordinary postage stamps are used in place of the special delivery stamp, the mail should be endorsed "Special Delivery."

# Government Should Let Business Set Reconstruction Pace

(Continued from page 974)

tary duties. Schwab came out flatly in favor of labor organization but with the proviso that such organization should be local to a given plant with the control of the body vested in local hands rather than in the hands of some national body which knows little of actual conditions probably thousands of miles from national headquarters.

## No Room for Pessimist To-day

There is not even standing room for the pessimist in American business to-day, said David L. Ludlum, in opening the meeting of the automobile group, and his statement was very ably backed up by George M. Graham, president of the Pierce-Arrow Motor Car Co., who stated that business faces a period of unprecedented prosperity.

With the practical dislocation of foreign trade Mr. Graham pointed out that dealers in the United States are given an unparalleled opportunity. Hand in hand with the opportunity of the dealer go the prosperity of the maker and the contentment of labor. Upon the ability of the dealer to distribute the product depends the ability of the maker to keep his plant busy and thus to keep his workers fully employed.

During 1917 there was a total of 1,718,000 vehicles marketed in the United States. The possible market in 1918 was 2,000,000 vehicles. Against these figures the actual conditions reveal that during the present year manufacturers of passenger cars and motor trucks have sold only 50 per cent of their market, and during this time they have been operating against the additional handicap of attempting to convert their business to 100 per cent war work.

With relation to cancellation of Government contracts, Graham deplored the excessively rapid action of the Government and stated that there was little that could be done now to alleviate conditions which might not have come to pass had the Government heeded the suggestions which it sought from the industry, but which it subsequently discarded. When the matter of contract cancellation first came up the automobile industry was requested to consult with Government authorities and to offer such recommendations as in its opinion would operate to the best advantage of all concerned. Motor vehicle makers, in approaching this problem, made only one request of the Government. That was that the Government adjust cancellations with this one thought in mind—"in what period of time can manufacturers turn from a war basis to a peace basis without creating conditions of unwarranted unemployment."

## Industry Will Readjust Itself

It is Graham's opinion that the automobile industry can and will readjust itself to a peace production basis without outside assistance. Despite disrupted manufacturing conditions, and

with sales organizations in many cases completely torn down, the sentiment still prevails in the industry that some of the manufacturers will get out. In consequence it is believed that the best policy will be to urge that the industry be left severely alone to follow its own problem.

It is believed that the 30,000 motor vehicle dealers of the country have sufficient enterprise, courage and zeal to put the industry back in its proper place in the sun.

"Motor car and motor truck dealers must by merchandising and salesmanship replace the domestic business that has been taken by war business," said Graham.

## Does Not Anticipate Disruption of Market

Graham offered as his opinion that there will be no disruption of domestic markets through the sale in the United States of trucks now owned and operated by the Government in France and England. It is not regarded as likely that the governments of our allies or that of the United States will permit trucks at present in use on the other side of the sea ever to come back to America. At present they are desperately needed for the transportation of food. With winter coming on, when railroads are demoralized and the waterways frozen solid and rendered useless, it is estimated that thousands of persons would literally starve to death for the lack of transportation facilities alone.

It is the belief, said Graham, that the trucks at present in use abroad will be held there. Trucks owned and operated by the Government in the United States will in all probability continue to be so owned and operated. It is likely that many thousands of army vehicles will be used for a long time at the various cantonments, that hundreds will be turned over to the postal authorities for the use of the post office, and there is a possibility that the railroads may be induced to take up the use of motor trucks as a means to relieve the rail carriers of short haul work.

## Against Restrictive Measures

Graham is uncontrovertibly against restrictive measures of any and all natures. He believes that the motor car industry must have a fair chance under normal competitive conditions to work out its own conservations and that the industry should not be controlled except by itself.

With regard to our merchant marine, the committee adopted a resolution which if put in force would go far to eliminate the possibility of a glutted market. It is urged that regardless of who may operate a merchant marine, makers, who have materials and unfinished products for which the Government has no use, be given the first opportunity to sell such products abroad through the medium of shipping provided by an American mercantile fleet.

The oil industry went on record to-night as against federal roadbuilding but favoring the construction and maintenance of highways under local supervision and by local and state taxation. This was something of a surprise, as most of the other 300 industries officially represented at Atlantic City have or will urge a strong federal roadbuilding program under a special cabinet officer.

The action was taken in the form of a resolution adopted by the group meeting of the oil and oil products group under the chairmanship of A. C. Bedford, chairman of the Standard Oil Co. of New Jersey. The resolution opposed the building of highways by the federal government until the constitution is changed giving more power to the highways commission and urging that for the present, highways be built and the roads to be improved be selected by the localities involved.

Other resolutions urged the National Petroleum War Service Committee to form a national association of the petroleum industry, and indorsed the attitude of the American government in protesting against any confiscation of American property in Mexico.

The surprising highway resolution followed a talk by Van H. Manning, of the Bureau of Mines, who, in telling of the possibilities of fuel conservation in the future and in pointing out ways in which the oil industry could improve its methods, stated that from 50 to 75 per cent of all the oil in the ground fails to reach the surface, being lost in the sands, etc. Another field of research which was pointed out as looking to a more complete use of the crude supplies is in the improvement in cracking oils to get their lighter constituents.

## Development of Oil Shales

Director Manning also pointed out the need of developing the enormous reserves of oil in the oil shales, but warned that such work was not one which could be engaged in without large capital or with the expectation of immediate dividends.

For years, he said, the United States has supplied two-thirds of the world's supply of petroleum. If transportation and other facilities were as good in other countries, among them Mexico, South America, and India, the world's output could be greatly increased. The American oil industry, he urged, must play a part in developing these foreign fields. He told the oil men that their industry had nothing to conceal and urged them to take the public into their confidence.

He complimented the oil industry for its part in the winning of the war and stated his pride in the American citizen for the way in which the public responded to the gasless Sunday request and other conservation measures. So valuable was this, he said, that a famous British admiral remarked: "We floated to victory on oil."

## Fordson Tractor Men Meet at Dearborn

### State Distributors Discuss Plans and Fix Trade Policies for Coming Year

DETROIT, Nov. 30—The State and district distributors of the Fordson tractor have been summoned to Dearborn, Mich., for a conference on Dec. 5 and 6. This summons automatically called off the meeting of the distributors, which had been set for Chicago on Dec. 2, 3 and 4.

The purpose of the conference is to discuss plans for the coming year, to fix the trade policies which Henry Ford & Son desire to see put into effect in handling the Fordson business during 1919, and to discuss such other matters as may affect the distributors as a body. Among other important matters which will come up for discussion is the discount which shall be given the Fordson dealer. On a percentage basis this now is just a little more than 11 per cent, a rate of commission which many of the dealers contend is too low when the cost of necessary service is taken into consideration. Some of the distributors will strive to have the commission raised so that it shall be at least on a parity with that given on Ford cars.

The summons to come to Dearborn for a conference on practically the same date the distributors' association had set for the Chicago meeting lends strength to the belief that Henry Ford is not entirely in accord with the purposes of the association. There are men in the association who chafe under dictation and who are disposed to assert a degree of independence of action which it is said does not altogether please Mr. Ford. It is intimated that at the Dearborn meeting the rights of the distributors to conduct their business in their own way and free from dictation from Dearborn may be threshed out.

#### Roadway Legislation Planned

WASHINGTON, Nov. 29—Indications point to the presentation of a number of bills before Congress for the establishment of highways throughout the country, and it is expected that this will be one of the important subjects at the next session. The immense value of the motor truck for rural express, postal service and as an auxiliary to railroads, the importance of highways for the development of food production, and the general increased value through education, and transportation accomplished by highways have been recognized by practically all the Government officials here in statements made at various times.

Secretary Houston of the Department of Agriculture stated this week that reconstruction plans must include highway construction under the federal aid road act. The public highways, he said, will be a vital factor, and construction should be started as soon as possible. Road

building he considers a worthy project for employment of the surplus labor supply expected to result from demobilization of the Army.

Under the federal aid road act federal and state funds appropriated for road building and not expended because of the stoppage of construction by the war will amount this year to about \$75,000,000.

#### Tractor Ousts Horse in Canada

TORONTO, ONT., Nov. 29—A census of the livestock of Ontario, figures of which are reported by the Grand Trunk Railway system, shows a decrease in the number of horses for 1918 over 1914 of from 774,000 to 733,000, due, says the report, to the influence of the tractor on farming. Tractor farming with government assistance has attained a great vogue in the province, and the uncertainty of the future demand for horses on account of growing use of the tractor has had a corresponding effect on the number of horses.

There has also been a noticeable decrease in the number of fowl, due to the fact that the care of fowls is mainly in the hands of women and children, who have been too busily engaged in the fields since 1915 to take care of poultry. The following table shows the number of heads of animals of various kinds and of poultry on Ontario farms in 1914 and 1918:

	1914	1918
Live stock		
Horses	774,000	733,000
Milch cows	1,006,000	1,102,000
Total cattle	2,604,000	2,812,000
Sheep	922,000	972,000
Hogs	1,770,000	1,656,000
Poultry	14,175,000	12,271,000

#### Baruch Resigns from War Industries Board

WASHINGTON, Dec. 2—Bernard M. Baruch has tendered his resignation as chairman of the War Industries Board, taking effect Jan. 1, and substantiating thereby the forecasts that all restrictions upon the peace time industries will be removed with the beginning of the new year. The activities of the War Industries Board have already been curtailed as rapidly as its releases with industries would permit. Further, all restrictions which were placed and were regarded necessary to complete the war program have been either removed or largely modified. The automobile industry is still held to a 75 per cent production basis, and motor truck makers must abide by the allotments for manufacture provided prior to Nov. 11 by the Automotive Section, War Industries Board, but both of these restrictions, it may safely be assumed, will be lifted by the end of this year.

#### Discover Fuel for Internal-Combustion Engine

WASHINGTON, Dec. 2—It is reported here that both the United States Navy Department and the National Advisory Committee for Aeronautics have discovered a fuel for internal combustion engines which is said to be superior to the new Liberty fuel, discovery of which was just announced.

## To Localize Contract Cancellations

### Adjustments to Be Made by District Boards—Two Appeals Are Possible

WASHINGTON, Nov. 30—A complete plan has been devised by the War Department for adjustment of war contracts, according to an announcement by Benedict Crowell, Assistant Secretary of War. After the War Department decides which contracts will be carried through or gradually tapered, and contractors are notified accordingly, the plan provides that the holder of a canceled war contract will make an inventory of the raw material on hand, work in process and finished articles ready for delivery, and any other items of cost with figures on the various elements of cost which enter into production, such as new buildings and machinery. This inventory will be checked by War Department accountants. The statements will then be presented to the district boards in the specific locality. District boards have been organized in all of the large cities that are centers of production.

A board to deal with ordnance contracts at each of these places will be presided over by the district ordnance chief, in every case a civilian and prominent business man in the community, and if possible a man connected with the prevailing industry of the locality. Another member of the board will be the regional advisor of the War Industries Board, and a third a man of legal training, the fourth a cost accountant, and fifth a highly experienced production expert. These boards, it is expected, will make just and prompt settlements on all claims.

Boards will also be established for the settlement of contracts for more standard articles of merchandise. These boards will operate along similar lines, and wherever a settlement can be reached between the contractor and board, recommendations arrived at will be forwarded to Washington to be finally approved and promptly paid in full.

Wherever there is a difference of opinion between the board and the contractor a statement can be made to the Claim Boards in this line of work in Washington which will consider the data presented and endeavor to reach a settlement with the contractor. Failing in this the matter will be taken up with the Board of Contract Adjustment of the War Department, which assists the Secretary of War and is the final tribunal in such cases.

If the contractor is still dissatisfied with the decisions he can appeal to the Court of Claims.

"The War Department," stated Mr. Crowell, "recognizes that it is highly important to make provisions for cases where contractors have such a considerable part of their working capital tied up in expenditures for labor and other disbursements on unfinished work that without a speedy repayment to the

contractors of at least a part of this sum they cannot make that prompt return of the plants to commercial work essential to prevent a break in their continuous operation and employment of labor.

"In many such cases, while it is practicable to determine readily a minimum sum which will be within the figure of ultimate settlement, it will frequently be difficult to fix with exactness the ultimate sum without a delay which will lose to the Government and the country the advantage of speedy return of such plants to commercial work.

"Where this situation exists and to meet it, it will be the policy of the Department to stand ready to enter into supplementary contract with such contractors by which a sum not to exceed 75 per cent of the amount which it is certain will ultimately be paid by the Government on the agreed basis of adjustment will be paid immediately to the contractor upon his consent to a termination of the original contract and a release to the Government of its obligations thereunder, the Department agreeing to pay subsequently such additional sum as it may determine will complete payment to the contractor on the agreed basis of adjustment.

"The machinery outlined above will be availed of in arriving at the terms of final settlement.

"This plan will make it practicable for contractors to secure almost immediately a very substantial part of their working capital for use in switching back to commercial work, even where the circumstances are such that the final determination of the compensation to be paid cannot be so speedily arrived at."

#### Attorney General Examining Contract Legality

WASHINGTON, Dec. 2—Attorney General Gregory will file an opinion shortly with regard to the legality of contracts which have not been legally executed—for example, those given and accepted verbally or by telegram. Congress may be asked to straighten out the tangle by adopting legislation to legalize such contracts. This problem was created by the stand taken by Controller Warwick of the Treasury, who maintains that where contracts were made by telegraph or telephone and not formally signed no contracts exist because they were not legally executed.

#### Fifth Avenue Bus Earnings

NEW YORK, Dec. 3—In its annual report, the Fifth Avenue Coach Co. shows total revenue of \$2,654,457 for the year ending July 30, 1918. This is an increase of \$410,640 over the preceding year. Net income amounts to \$399,147 after deduction of expenses and taxes, and the surplus for the year is \$191,794.

#### Willys-Overland Declares Quarterly Dividend

NEW YORK, Dec. 3—The Willys-Overland Co., Toledo, Ohio, has declared a regular quarterly dividend of 1% per cent on its preferred stock. The dividend is payable Jan. 1, 1919, to stock of record Dec. 20.

## Record Earnings for U. S. Rubber

### Shows \$21.64 Per Share for First Six Months of 1918—Assets Triple Liabilities

NEW YORK CITY, Nov. 30—The United States Rubber Co. established record earnings during the 6 months ended June 30, 1918, when it earned \$21.64 a share on outstanding common stock amounting to \$36,000,000. The extraordinary record which has been made is indicated by the fact that during the entire year of 1917 the company earned only at the rate of \$28.77 per share.

At the present time current assets exceed current liabilities by three and one-half to one, despite the fact that the company has charged off nearly half a million dollars more for war taxes during the first 6 months of the year than it did for the full year of 1917.

The following is the consolidated balance sheet of the company and its subsidiary:

ASSETS			
	June 30, '18	Dec. 31, '17	Dec. 31, '16
Plants, etc.	\$132,322,696	\$128,105,826	\$130,187,629

Total	\$276,143,082	\$257,575,781	\$222,366,569

\*These reserves have been set up to provide against shrinkage in inventories that may arise from post-war conditions, and possible increase in taxes if basis of taxation should be changed by a new revenue law—provision for taxes having only been otherwise made on same basis as called for by existing tax laws.

#### Export Conservation to Be Shortened

WASHINGTON, Nov. 29—There will be a reduction in the items listed on the export conservation list shortly, according to announcement by the War Trade Board. Whether automotive products will be included in those items removed from the list and thereby allowed free export or not has not yet been decided by the board, which will make a definite announcement in the very near future.

Further modifications of rubber import restrictions announced to-day allow the

importation from overseas of not to exceed 900 tons of utta-siak in addition to the 740 tons heretofore approved.

Under a new export ruling steel can be shipped abroad to any destination without application for priority certificates from the War Industries Board.

Importers are requested in a new ruling to certify on their invoices where the goods were manufactured, or where they were purchased or contracted to be purchased for export to the United States, or where they were assembled for shipment to the United States.

#### Buyer from South Africa Here

NEW YORK, Dec. 3—L. H. Shapiro, representing S. Smith & Sons, Ltd., and H. W. Allkin & Co., Ltd., of Port Elizabeth, South Africa, is making a tour of the U. S. for the purpose of getting in touch with manufacturers of automotive products. He is especially anxious to hear from makers of accessories and parts for Ford and other cars, and can be communicated with at the National Bank of South Africa, 10 Wall Street, New York.

#### Studebaker Note Issue Coming

NEW YORK, Dec. 2—The Studebaker Corp. is considering additional financing which, according to President A. R. Erskine, probably will take the form of a new issue of notes. The purpose is to pay off a considerable amount of floating indebtedness and provide funds for other essential purposes. It is stated that there will be no new issue of preferred stock.

#### Chandler in Strong Position

CLEVELAND, Nov. 29—It is reported that the passenger car production of the Chandler Motor Car Co. for the present year is between 9000 and 10,000 as compared with a production of 15,000 cars in 1917. In addition about 1000 tractors have been built for government. Earnings are expected to be in excess of \$1,400,000 after deduction for taxes.

#### Prices Fixed on Hides Expire

WASHINGTON, Nov. 30—The maximum prices fixed by the War Industries Board on foreign hides and skins to cover shipments or take off during November and December, 1918, will expire automatically by limitation and will not be continued. Any foreign hides or skins sold on or after Jan. 1, 1919, ordered in this country, foreign countries or in transit, will not be governed by maximum prices.

#### Foreign Agency Desired

WASHINGTON, Nov. 29—The Bureau of Foreign and Domestic Commerce, Department of Commerce, has an inquiry from Switzerland desiring an agency for the sale of automobiles and agricultural implements. Further information can be secured by applying to the bureau and mentioning "Opportunity No. 27724."

WASHINGTON, Nov. 30—Detailed figures supplied by the Bureau of Foreign and Domestic Commerce show that for the year ending June 30 the total number of automobiles and motor trucks exported, not including cars and trucks shipped abroad for use of the American Expeditionary Forces, was less than in the fiscal years ending June 30, 1916 and 1917, but materially greater than in 1915 or any preceding year.

The record for the last six years is as follows:

Fiscal Year	Passenger Cars		Commercial Cars	
	No.	Value	No.	Value
1913.....	24,293	\$24,275,793	993	\$ 1,737,141

## Six Years' Exports of Cars and Trucks

Shipments Aggregated 52,312  
Passenger Cars and 12,200  
Trucks, Valued at \$77,-  
205,825

The total valuation of passenger and commercial car exports during the last fiscal year, despite war conditions, was \$77,205,825, compared with \$90,956,134 in the 12 months ended June 30, 1917; \$97,465,811 in 1916; \$60,254,635 in 1915, and \$26,574,574 in 1914, the last pre-war year.

In addition, there were shipped to our non-contiguous territories: Alaska, 96 automobiles, valued at \$86,771; Hawaii, 1554, value \$1,507,498, and Porto Rico, 1106, value \$1,146,533 (class of cars not stated).

### Fuel Restriction May Soon Be Abolished

WASHINGTON, Nov. 30—The likelihood of modification of the fuel restrictions upon the automobile industry by the Fuel Administration is forecast by action taken by the Administration to-day in releasing several other industries from their curtailment programs. The florist, glassware and cement industries have been allowed to secure 100 per cent coal.

Plans now are for the abolition of the Fuel Administration by Jan. 1, 1919. Arrangements are being made with the Bureau of Mines and the Department of Interior generally to take over the various Fuel Administration departments. The Bureau of Mines will probably take over the oil and coal divisions, the Geological Survey and the Statistical Department.

### Canadian Tractor Men Support Duty on Imports

NEW YORK, Dec. 2—Canadian manufacturers of farm implements and tractors have entered the lists with the Consolidated Grain Growers over the importation of American tractors into Canada duty free. They claim that this practice is having a deleterious effect on Canadian industry and should be stopped. The Grain Growers, on the other hand, insist that the Canadian industry is not adequate to care for the tractor demand of the Dominion and that cheap tractors should be permitted to enter without duty.

Early in 1918 the Canadian Government eliminated the duty on farm tractors costing less than \$1,400. This was done as a war measure and to encourage food production. Larger tractors have never been found suitable for use in Canada.

In consequence of the elimination of the duty four times the number \$3,259,670 were imported into Canada in 1917 as in the previous year. During 1917, 2792 American tractors valued at \$3,259,670 were imported into Canada. During the period between Feb. 7 and Oct. 31, 1918, a total of 8684 tractors valued at \$7,993,916 was imported.

The normal import duty on farm tractors is 20 per cent plus a special war tax of 7½ per cent. Farm implement manufacturers would like to see this tax applied as before the special exception was made. They contend that this duty is necessary to protect Canadian industry.

**Hovey Made Eclipse Vice-President**

BELOIT, WIS., Nov. 29—W. S. Hovey, for 5 years general manager of the Eclipse works of the Fairbanks-Morse Mfg. Co. at Beloit, Wis., has been elected vice-president in charge of all manufacturing of the organization. Mr. Hovey has moved his headquarters from Beloit to the general offices in Chicago, from which he will direct the plants at Beloit, Baltimore, Three Rivers, Mich., and Indianapolis.

**Major Segrave Returns to England**

WASHINGTON, Nov. 27—The British Aviation Mission has closed its offices preparatory to returning to England, and included with those who are relinquishing their duties in this country is Major H. O. D. Segrave, who has been the direct point of contact between the British Aviation Mission forces and the American Division of Military Aeronautics. In addition, Major Segrave has performed the important work of enlightening the American public through the press of the accomplishments of the British Air Forces. Prior to coming to this country Major Segrave served both with the active forces in France in the infantry and as a flier, and with executive divisions in England. The knowledge which the American public has of British air activities is due more to the information given out by Major Segrave than to any other agencies.

**Racine Rubber Secretary Dies**

RACINE, WIS., Nov. 30—Herbert C. Severance, secretary and general sales manager of the Racine Rubber Co. and a director of the Ajax Rubber Co., died recently at his home here. He was appointed general sales manager of the Racine Rubber Co. Nov. 1, 1913, and later elected secretary.

J. W. Powelson has been appointed works manager of the Pittsburgh plant of the Pittsburgh Model Engine Co. He was for a number of years production engineer of the Rochester Motors Co., Rochester.

**Chandler Declares Quarterly Dividend**

CLEVELAND, Dec. 2—The Chandler Motor Car Co. has declared a regular quarterly dividend of \$3 per share, payable Jan. 2, 1919, to stock of record Dec. 17.

**Ordnance Board of Claims Personnel Announced**

DETROIT, Dec. 4—The personnel of the Ordnance Board of Claims was announced yesterday as follows:

F. J. Robinson, chief of Ordnance District, chairman; C. E. Huyette, assistant chief; Major P. C. Thomas; Major C. W. Owston; C. C. Jenks, president of the Security Trust Co.; Captain J. G. Dalglish, secretary, and Captain C. A. Strand, chief of the investigating staff.

## Men of the Industry

*Changes in Personnel and  
Position*

**Willys-Overland Promotes Officials**

TOLEDO, Dec. 2—Edward H. Belden has been elected vice-president in charge of engineering, and Kelly R. Jacoby vice-president in charge of purchase of the Willys-Overland Co.

Richard A. Watson, secretary and production manager of the American Bronze Corp., Berwyn, Pa., has resigned his active duties with the company, but will continue as a member of the board of directors. He has resigned in order to carry on experimental work in connection with several patents in which he is interested. No successor has been appointed as yet.

**Lt. Col. Barrett Andrews Returns to Civil Life**

WASHINGTON, Dec. 2—Lt. Col. Barrett Andrews, head of the Training Section, Motor Transport Corps has received his discharge from the Army and will return to his civilian pursuits.

**Lt. Col. Uhler Resigns from M. T. Corps**

WASHINGTON, Dec. 2—Lt. Col. W. D. Uhler, head of the Convoy Service of the Motor Transport Corps has resigned and returned to his duties as Highways Commissioner of Pennsylvania.

**Frank Turner Is Buick Comptroller**

DETROIT, Dec. 4—President Walter P. Chrysler, of the Buick Motor Co., Flint, announces the appointment of Frank Turner, of Wilmington, Del., formerly comptroller of the DuPont company, as comptroller of the Buick company, to succeed L. M. Ohland. Mr. Ohland will later assume an important executive position with the General Motors Corp. in New York. E. W. Procter, also of the DuPont company, will succeed J. M. Ryan as assistant treasurer of the Buick company, Ryan having resigned. Both these appointments are effective Dec. 1.

**Wadhams Oil Co. Gives Insurance**

MILWAUKEE, WIS., Dec. 2—The Wadhams Oil Co., 359 Clinton Street, Milwaukee, one of the largest independent refiners and distributors of petroleum products in the Northwest, has presented each of its 150 direct employees with a free life insurance policy under the group insurance plan. The policies are fully paid by the company and range from \$500 to \$2,000, according to the term of service of the insured employee.

**Brickbauer Heads Plymouth Motor**

PLYMOUTH, WIS., Nov. 29—The Plymouth Motor Mfg. Co., formerly the Steiner Mfg. Co., Plymouth, Wis., at its annual meeting elected the following officers: President, George W. Brickbauer; vice-president, Charles Steiner; secretary, Frank Schryer; treasurer, Gust. W. Schiereck; directors, George Gerhard, H. J. Goelzer and C. C. Arndt. The company manufactures gasoline and kerosene engines and motors, and orders now on the books indicate that the coming year will be one of the busiest in its existence.

**McConnel to Represent M. A. M. A.**

WASHINGTON, Nov. 29—R. M. McConnel, formerly connected with the Firestone Tire & Rubber Co. at the Detroit branch, has arrived here to represent the Motor and Accessories Manufacturers Association. Mr. McConnel will be the point of contact for the manufacturers in the association with the Government.

B. T. McDonald, Jr., has been appointed superintendent of the Moline Plow & Tractor Co., to succeed J. L. Irving, who becomes vice-president and general trade manager. Mr. McDonald was formerly with the Poughkeepsie and Stoughton branches and also founded the McDonald Pitless Scale Co., which was absorbed by the Moline company 8 years ago.

S. E. Cole has been appointed manager of the Omaha branch of the H. W. Johns-Manville Co. He succeeds Chas. F. Simms, deceased.

L. E. Schumacher, who for the past eight years has been chief inspector of the Westinghouse Electric & Manufacturing Co. at East Pittsburgh, Pa., has been promoted to works manager of the Krantz Manufacturing Co. of Brooklyn, N. Y., the latest subsidiary of the former company.

James A. Bennett has been appointed purchasing agent of the Connecticut Telephone & Electric Co. of Meriden, Conn. This appointment is in the nature of a promotion for Mr. Bennett, who for some time past has been connected with the sales department of this company.

**Puritan Gets American Ball**

DETROIT, MICH., Nov. 30—The Puritan Machine Co. has purchased from the American Ball Bearing Co., Cleveland, its entire service and repair parts business, including a complete stock of parts, tools, jigs, dies, blueprints, etc., covering all American axles manufactured prior to Jan. 1, 1918. The stock is being moved to the Detroit plant of the Puritan company.

**Gerlinger Electric Steel Starts**

MILWAUKEE, WIS., Nov. 29—The Gerlinger Steel Castings Co., Milwaukee, which expects to place in operation a large new electric steel foundry on Dec. 10 or 14, has formed a new corporation to control the new plant. This is known as the Gerlinger Electric Steel Foundry Co., and is capitalized at \$99,000. At the same time the original company has increased its capital stock from \$25,000 to \$75,000. The ownership of both corporations is virtually identical, the principal officers being George P., William E., Walter and Charles A. Gerlinger, all of them pioneer foundry operators of the Milwaukee district and among the first to employ the electric furnace process of manufacturing castings. The concern is widely known in the motor car, truck and tractor manufacturing industry.

**Pull-More Plant on Block**

NEW CASTLE, PA., Nov. 30—The plant and equipment of the Pull-More Motor Truck Co. is to be sold by the receiver on Friday, Dec. 27, at 2 p. m. Included is a brick building 100 by 500 and 20 acres of ground.

**International Steel Nearly Ready**

HARTFORD, WIS., Nov. 29—The International Steel Products Co., formerly of Milwaukee, hopes to be able to begin operations in its new \$40,000 works at Hartford, Wis., on Dec. 2. The company will specialize in the manufacture of mufflers or silencers for motor vehicles and gas engines and its initial capacity will be 1000 mufflers a day.

**Not to Take Ford Milwaukee Plant**

MILWAUKEE, Nov. 29—Official announcement that the Government had abandoned the project of converting the Milwaukee assembling plant of the Ford Motor Co. into a reconstruction hospital was received in Milwaukee on Saturday, Nov. 23, by owners of apartment buildings near the plant, which has been commandeered to serve as officers' barracks, nurses' homes and for similar purposes.

**Two New Allis-Chalmers Tractors**

MILWAUKEE, WIS., Nov. 29—The Allis-Chalmers Mfg. Co., Milwaukee, which for several years has manufactured farm tractors in a single standard model, known as a 10-18, has increased the line to embrace two new models. One is a 6-12, listing at \$790, and the other a four-wheeled type, rated 15-30.

**Standard Foundry Co. Erects Plant**

RACINE, WIS., Nov. 30—The Standard Foundry Co., Racine, Wis., a large gray iron casting plant, has awarded contracts for the erection of a \$50,000 foundry building, 80 x 200 ft. in size, and of brick and steel construction. It is to be ready to begin operations shortly after Feb. 1. Arthur G. Janes is president and general manager.

## Current News of Factories

*Notes of New Plants—Old  
Ones Enlarged***Universal Motor Increases Capital**

OSHKOSH, WIS., Dec. 2—The Universal Motor Co., Oshkosh, Wis., manufacturer of direct-connected generating systems for isolated power and illumination requirements, has increased its capital stock from \$50,000 to \$100,000. The company has been filling large Government orders for mobile repairshop power units.

**Board of Review Contracts**

WASHINGTON, Nov. 30—The following contracts were placed by the Board of Review prior to the signing of the armistice and have just been announced: Mandeef Mfg. Co., Springfield, car hubs, \$8,800. McCord Mfg. Co., Detroit, radiators, \$7,020. McCord Mfg. Co., Detroit, radiators, \$7,687.50. Ford Motor Co., Detroit, Ford cars, \$235,887.50. Locomobile Co. of America, Bridgeport, chassis, \$2,232,230. Covert Gear Co., Lockport, clutches; seven clutches additional at \$0.8087 shall be delivered. United States Tire Co., New York, casings and tubes f.o.b. delivery point to be Detroit instead of New York. Dodge Bros., Detroit, Dodge cars; contractor may deliver Elsemann magneto G-4, \$18.50 or Simms magneto at \$12.50 when available. Cadillac Motor Car Co., Detroit, automobiles: change in specifications and price from \$3,309 to \$3,360; also \$7 for Klaxon horn and 50 cents switch key additional.

**Quartermaster Contracts**

WASHINGTON, Nov. 30—The following orders were placed by the Quartermaster Department on Nov. 1, prior to the armistice, and just announced:

Ford Motor Co., Detroit, motor parts, \$5,140.67. Chandler Radiator Co., Detroit, radiators, \$12,600. Pierce Oil Corp., New York, oil, \$1,478.40. Atlantic Refining Co., Philadelphia, gasoline, \$11,550. Indian Refining Co., New York, motor oil, \$572.90. Gulf Refining Co., Pittsburgh, gasoline, \$4,926. Gulf Refining Co., Pittsburgh, fuel oil, \$3,816. Atlantic Refining Co., Philadelphia, gasoline, \$5,577.

**Ordnance Contracts**

WASHINGTON, Nov. 30—The following contracts were placed by the Ordnance Department prior to the signing of the armistice and have just been announced:

Bljor Motor Appliance Co., Generator-starters, etc., \$120,466. Langstadt-Meyer Construction & Supply Co., gasoline, engine driven generator sets, \$40,590. Chatham Machine & Tool Works, tools and accessories for mobile repair shop, \$20,473.35. Hale & Kilburn Corp., dismounting, camouflaging art. rep. trucks, \$15,000. Dorris Motor Car Co., air pressure pumps for petrol tanks, \$57,000. Holt Mfg. Co., ex-work on caterpillar gun mounts, \$15,000.

**Prest-O-Lite Refill Station Damaged**

MILWAUKEE, Nov. 29—The Milwaukee filling or compressing plant of the Prest-O-Lite Co., Indianapolis, was almost totally wrecked by an explosion last week. One workman was killed and another fatally injured. The plant is located at Thirty-third Avenue and Mitchell Street, in West Milwaukee. The cause of the explosion is not yet known, but suspicion has been aroused by the finding of a loaded bomb in the vicinity. It is expected that the plant will be rebuilt at once.

**Cars Coming from Madison**

MADISON, WIS., Nov. 29—The Universal Products Co. of Madison, Wis., has been organized, with a capital stock of \$50,000, to engage in the manufacture and sale of motor cars, trucks, tractors, machinery and other equipment, and the installation of lighting and heating plants. The incorporators are John L. Newman, John L. Bourke and Ethel Lee, all of Madison.

**No Curtiss Plants to Close**

BUFFALO, Nov. 29—The Curtiss Aeroplane & Motor Corp. does not intend to close any of its plants, despite the cancellation of Government contracts. It was stated by an official of the company that the shops will be kept busy on aircraft for other than war use. The experimental field at Garden City, L. I., will be maintained.

**Syracuse Home for Lippard-Stewart**

BUFFALO, Nov. 29—The Lippard-Stewart Motor Car Co. has been completely reorganized with additional capital. The entire stock and equipment of the company is being moved from Buffalo to Syracuse, where the business will be carried on henceforth. Plans and specifications of new models will be made public shortly.

**More Room for Canadian Allis-Chalmers**

TORONTO, Nov. 29—The Canadian Allis-Chalmers Co. has had plans prepared for an addition to its gray iron foundry, to cost \$20,000. Work on the proposed addition will be started as soon as possible. Part of this plant will be used for tractor production.

**Ralston Iron Adds Trucks**

SAN FRANCISCO, Dec. 2—The Ralston Iron Works, which for the past 4 years has been manufacturing the Ralston truck unit, has added trailers and semi-trailers to its line as well as pole and lumber dollies and special trailer equipment. The company has taken over the Hewitt-Ludlow motor truck plant, now under construction, and is planning to increase the production of Hewitt-Ludlow 1½ to 5-ton trucks. Pratt & Williams, which has heretofore distributed Ralston products, hereafter will be exclusive distributor.

### German Piracy of American Trademarks (Continued from page 967)

Congress, and to which considerable publicity has been given, appears now likely to be abandoned in favor of the adoption of the simple form of marking, consisting of the words "Made in U. S. A."

The national trademark proposition has been thrashed out from all angles by English commercial organizations and others over a period of years, and the final conclusion has been reached that a mark consisting of a device is likely to be detrimental rather than otherwise in the building up or reorganizing of foreign trade, and the probability is that nothing further will be done along these lines in England.

### Favor Country-of-Origin Mark

It seems now to be generally admitted that the use of a national trademark in the form of a device must of necessity detract from the value of the trader's own mark, and it is believed that the best protection can be secured by endeavoring to obtain the enactment of laws in the United States and abroad which would make it an offense to sell goods manufactured in other countries without carrying thereon a clear indication as to the country of origin. Dumping of goods on the American market without indicating the country in which such goods are made would thus be avoided, and the American manufacturer who desires to see the United States obtain its full share of foreign trade would be encouraged to turn out the best make of goods and thus add prestige to the mark "Made in U. S. A."

## New Loening Plane Breaks Record

### Travels 145 M.P.H. with Full Military Load, Including 4 Guns

WASHINGTON, Dec. 3.—Announcement of a new airplane—the Loening 2-seater monoplane—was made in Washington to-day, together with the information that the plane has developed 145 m.p.h. with a full military load, including 4 guns, which is in excess of any record made by a European single seater combat machine. The Loening plane in its tests also climbed to 25,000 ft. in remarkable time, which has not been made public, carrying 2 passengers and thereby establishing another new record.

The plane is American designed and American built. It is smaller than the DeHaviland-4 of course, and weighs only 2400 lb. loaded for the air, which is practically the weight of a single seater scout. It is driven by an 8-cylinder 300 hp. Hispano-Suiza. The whole power plant is a unit construction and can easily be removed from the body of the plane. There are several original ideas in the under strutting. The arrangement of the seats provides the pilot with 50 per cent more vision than any other combat machine produced prior to or during the war. The plane carries sufficient fuel for 3½ hr.

Grover Cleveland Loening, the designer and builder, is an American, an aero engineer with 8 years' experience, and the

author of several text books used in study by American flying cadets. He is connected with the Loening Aeronautical Corp., 45 West Eleventh Street, Long Island City, New York.

### Co-ordination of Legislative and Operative Functions in Labor

(Continued from page 959)

operating leaders and their subordinates and tending to decrease the operating efficiency.

The attitude of the worker in looking to his occupational labor organization for his advantage in legislative industrial matters tends to destroy any organization incentive which he may have and carries him from place to place upon any fancied grievance, tends to increase his desire to protect his occupation as a class, to enforce his attempt to control the conditions of his work, and makes in other ways for continued strife and industrial inefficiency.

There is no hope in the destruction of labor organizations, even if that were possible, because the present system of organizing the industrial unit has failed to satisfy the requirements in such important particulars that the destruction of the present labor organizations would necessitate a demand for political relief.

As a matter of fact, however, labor organizations are getting stronger, and unless some means are taken to provide proper machinery for the control of the legislative functions of the industrial unit, the outlook is one of increased conflict and increased political interference with industrial operations.

# Calendar

## ENGINEERING

### S. A. E. Meetings 1919

- Jan. 8—Minneapolis Section, S. A. E.—Hotel Radisson. "Governors for Tractors and Truck Engines."
- Jan. 12, 13, 14—New York. Winter Meeting, Society of Automotive Engineers, Engineering Societies' Building.
- Feb. 5—Minneapolis Section, S. A. E.—Hotel Radisson. "Radiator Cooling Fans."
- March 5—Minneapolis Section, S. A. E.—Hotel Radisson. "Tractor Service and Sales."
- April 2—Minneapolis Section, S. A. E.—Hotel Radisson. "Implements Designed for Tractor Belt Power and Their Characteristics."

## MOTOR SHOWS

- January—Detroit, Mich. Detroit Automobile Dealers' Assn. H. H. Shuart, Manager.
- January or February—Milwaukee, Wis. Milwaukee Auto Trade Assn. Bart J. Ruddle, Manager.
- Feb. 15-22—Louisville, Ky. Louisville Auto Dealers' Assn.

- Feb. 15-22—Newark, N. J. N. J. Auto Exhibition Co. Calude Holgate, Manager.
- Feb. 15-22—Minneapolis, Minn. Minneapolis Auto Trade Assn. Walter B. Wilmot, Manager.
- Feb. 17-22—Des Moines, Iowa. Tenth Annual, Des Moines Automobile Dealers' Assn. C. G. Van Vliet, Manager.
- Feb. 17-24—Passenger Cars; Feb. 24-27, Trucks—South Bethlehem, Pa. Lehigh Valley Auto Shows Co. J. L. Elliott, Manager.
- March 3-8—Buffalo, N. Y. Buffalo Automobile Dealers' Assn.
- March 1-10—San Francisco, Cal. Motor Car Dealers' Assn. G. A. Wahlgreen, Manager.
- March—Boston. Boston Automobile Dealers' Assn. Chester I. Campbell, Manager.
- Second or third week March—St. Louis, Mo. St. Louis Auto Mfrs. & Dealers' Assn. Robert E. Lee, Manager.
- March 22-29, Passenger Cars; April 1-5, Trucks—Brooklyn. Brooklyn Motor Vehicle Dealers' Assn. I. C. Kirkham, Manager.
- Third week March—Trenton, N. J. Trenton Auto Trade Assn. John L. Brock, Manager.

Probably February—New York. Automobile Dealers' Assn. Charles A. Stewart, Manager.

Probably March—Chicago. Chicago Automobile Trade Assn.

March—Philadelphia. Philadelphia Automobile Auto Trade Assn. A. L. Maltby, Manager.

March—Pittsburgh. Automobile Dealers' Assn. of Pittsburgh. John J. Bell, Manager.

March—Syracuse, N. Y. Syracuse Automobile Dealers' Assn. Harry T. Gardner, Manager.

March—Utica, N. Y. Utica Motor Dealers' Assn. W. W. Garabrant, Manager.

Late March or early April—Cleveland, Ohio. Cleveland Auto Show Co. Fred H. Caley, Manager.

April 5-12—Montreal, Can. Automobile and Used Car Exposition. T. C. Kirby, Manager.

Not decided—Bridgeport, Conn. Auspices of City Battalion. B. B. Steiber, Manager.

Not decided—Harrisburg, Pa. Harrisburg Motor Dealers' Assn. J. Clyde Myton, Manager.

Not decided—Hartford, Conn. Hartford Automobile Dealers' Assn.

Not decided—Indianapolis. Ind. Indianapolis Auto Trade Assn. John B. Orman, Manager.

Not decided—Kansas City, Mo. Kansas City Motor Dealers' Assn. E. E. Peake, Manager.

## TRACTOR SHOWS

Feb. 10-15—Kansas City, Mo. Fourth Annual Tractor Show. Sweeney Building. Kansas City Tractor Club. Guy H. Hall, Sec.

Feb. 18-22—Wichita, Kan. Annual Mid-west Tractor and Thresher Show. Wichita Tractor and Thresher Club. Forum.

## CONVENTIONS

Dec. 16, 17, 18—Chicago. Convention, National Association of Automobile Accessory Jobbers. (Directors and Committees, Dec. 16; General Sessions, Dec. 17-18.)

Jan. 12-14—New York. Meeting, Society Automotive Engineers.

Feb. 25-28—New York. Sixteenth Annual Convention. American Road Builders' Assn.

# Official History of Aircraft Production

(Continued from page 969)

from the United States Government as soon as they had finished their foreign contracts.

"It was clearly apparent that the speediest and most satisfactory method of handling the engine situation would be to develop a distinctive American engine which would adapt itself to American methods of manufacture. Numerous experimental engines had been made by various companies, none of which were adapted to war requirements.

"The Hall-Scott Co., at Berkley, Cal., had for several years been manufacturing aviation equipment for use by foreign governments, chiefly in the Orient, and E. J. Hall, of that company, had traveled in Europe at about the beginning of the war and had inspected the engines made both by the Allies and by the Germans.

## Packard Developments

"The Packard Motor Car Co. had for approximately 2 years been working on the development of an aviation engine of the 200 hp. class. This engine had not been flown in a plane but had been successfully used in racing cars. It was, however, too heavy for war purposes, but represented the farthest advance in this country toward the development of an aviation engine. J. G. Vincent, chief of the engineering forces of the Packard company, had, by reason of this development and of his study of the subject, acquired a large understanding of aviation engines.

"Mr. Deeds, therefore, called Vincent and Hall into conference in Washington in May, 1917, and on May 29 these two men started the design of an American aviation engine to develop approximately 200 hp. with 8 cylinders and 300 hp. with 12 cylinders.

## Organized Staff of Draftsmen

"They organized a large force of draftsmen, and as rapidly as they completed drawings they were hurried to the Packard Motor Car Co. in Detroit, and in its tool room corresponding parts were made.

"This work was expedited so rapidly that on July 4, 1917, a complete 8-cylinder engine was delivered in Washington. It was set up at the Bureau of Standards and ran successfully. The development of the engine was pushed rapidly, both at the Bureau of Standards and at the Packard Motor Car Co. in Detroit, and the developmental work on 8 and 12-cylinder engines was hurried forward by a large corps of expert engineers and mechanics.

"In August, 1917, the production of aviation equipment was constituted in the Equipment Division of the Signal Corps, and the Engine Production Department was created as a portion of that division. On that date the writer was put in charge

of the Engine Production Department and the real work of producing engines was begun. Engines required fell naturally into three classes:

- "1. Elementary training.
- "2. Advance training.
- "3. Combat.

"As to the elementary training, there were available the following engines:

- "Curtiss OX, of approximately 90 hp.
- "A-7A, 4 cylinder engines of approximately 100 hp.
- "Hall-Scott.

## Orders Consummated Rapidly

"Orders were consummated for the production of these engines as promptly as possible.

"For advanced training, there were available the Gnome 110 hp., the LeRhône 80 hp., and the Hispano-Suiza 150 hp. The General Vehicle Co. proceeded with the production of the 110 hp. Gnome.

"The Union Switch & Signal Co. had been persuaded to take the contract for the production of the 2500 LeRhône engines, 80 hp. type. Their contract has been continued and the Union Switch & Signal Co. has delivered up to this date approximately 1200 of these engines. We have had the assistance of Georges Guilhot, the engineer of the French Gnome and LeRhône factories, who pronounces the engines built for the Union Switch and Signal Co. to be the best rotary engine ever constructed.

"We arranged with the Wright-Martin Co. to increase their facilities for the production of the 150 hp. Hispano type, and their work had such good results that in May, 1918, that company delivered 530 of these engines.

"As to combat engines, it was clear that the only one available for our manufacturing purposes would be the Liberty, and the test made of it in the months of July and August showed that it functioned properly, and was a satisfactory engine. We therefore started production of it.

## Contract for 27,000 Engines

"It was estimated that we would require 22,500 of these engines to take care of the requirements of our Navy and Army. We therefore made contracts as follows:

- "Packard Motor Car Co.....6000
- "Lincoln Motors Co.....6000
- "Ford Motor Co.....5000
- "Nordyke & Marmon.....3000
- "General Motors Corp. (Buick-Cadillac) .....2000
- "Trego Motors Corp..... 500

"The first of these contracts was signed in August, 1917, and production work started immediately.

"Difficulties attending production in general grouped themselves as follows:

(a) Machinery—none of the existing motor plants had machinery of sufficient

sizes to handle the parts of the Liberty engines.

"(b) Small tools, fixtures and equipment—To produce every part of the Liberty engine requires between 2500 and 3000 of such small tools, jigs and fixtures.

"(c) Labor—It was soon found that men who were able to make the comparatively simple automobile motors did not have the skill required to machine parts of Liberty engines.

"(d) Unfriendly influence—Some of them were the result of pro-German influence.

"(e) Governmental activities—Every department of the Government was anxious to secure for its special work a large number of tool makers and skilled mechanics.

"(f) The Draft—This took a great many men out of this employment.

"(g) Materials—The materials required for the engines were of a much higher grade than corresponding material in automobile motors and work was required to secure proper production of materials.

"(h) Transportation and Coal—During the winter of 1917-18 the difficulties of transportation and of securing fuel were at times almost insurmountable.

"The Liberty 12-cylinder engine as originally designed was of the 300 hp. class producing approximately 330 hp. All the parts of the engine were designed to stand the stresses incident to this horsepower. An aviation engine is required to have the lightest possible weight with the maximum of power developed; therefore, each part is strained almost to its limit.

## Liberty Horsepower Increased

"When we had succeeded in getting tools and equipment to build this 330 hp. type and had produced approximately 300 of them, we were advised by authorities in France that higher horsepower would be required. By readjustment of the parts the engineers stepped up the horsepower of this engine to 375, with the result that certain of the parts would not stand this strain, notably the crankshaft, and it was necessary to stop productive efforts and increase these parts to stand this additional power requirement.

"After several weeks work this was accomplished and when we had produced approximately 500 of this type we were again notified that an increase in power would be required and that what would be needed for the summer of 1918 would be 400 hp. or over.

"We, therefore, again delayed production while the engineers rearranged the engine parts so that the engine would develop approximately 440 hp. The resulting strain placed on all the parts the engine was too great. We w

obliged to enlarge and strengthen crankshafts, connecting rods, bearings, etc., etc., together with all the adjacent parts.

"It became necessary to change the metallurgical specifications, which resulted in changes in the methods of the steel mills. In increasing the size of the parts all of the jigs, tools and fixtures in the machine building plants, the parts factories, forging ships, etc., were rendered obsolete and we had to construct new equipment to meet all these conditions, in order to meet the requirements as given to us by our aviation authorities in France.

"The extent and magnitude of these changes so required is illustrated by the fact that the engine when competent to develop 330 hp. weighed 785 lb. without water or oil, while when it was competent to develop 440 hp., it weighed 860.

#### 1100 Liberty 12's in a Year

"In spite of this difficulty, on May 29, 1918, one year after the first scratch of the pencil toward the design of the engine was made, we had produced and delivered into service 1100 Liberty 12-cylinder engines. This is an accomplishment which has not been equalled heretofore in this or any similar industry, either in this country or elsewhere.

"Much agitation has centered about the assertion that thousands of changes were made in this engine. This agitation is entirely incorrect and unfounded. The changes arranged themselves in 3 groups:

"(a) Design.

"(b) Increase of power.

"(c) Manufacturing limits.

"As to design—there have been but two changes in design in this engine since it was first laid out in May, 1917. One of these was to change the oil system from the so-called scupper feed to forced feed. Either system worked properly on the engine, but the latter system is fool-proof, while the former is not. We, therefore, substituted the latter system. The other design change was an alteration in one part of the connecting rod to allow the rod to have sufficient play without cracking.

#### Agitation Over Changes Unfounded

"The changes due to increasing the horsepower twice are covered by the foregoing subdivision. These were the results solely of the demands of our Aviation authorities that the power be increased.

"In manufacturing—As the engine was used in service and as the manufacturing progressed, it became evident that some of these limits should be changed and this action has been followed. This is the common practice in all manufacturing establishments. It has always been so on automobile motors and will always be so on any manufactured product. As new manufacturing processes are developed and as experience is gained manufacturing changes are always expected and are always made.

"Therefore, the agitation about changes in the engine, when examined and understood, is unfounded.

"The writer procured an order from

the head of the Equipment Division locking up the development of this engine in the Detroit District in charge of Major Heaslet, formerly vice-president of the Studebaker Corp.; Major Hall and a committee of manufacturers composed of: H. M. Leland of the Lincoln Motors Co., C. Harold Wills of the Ford Motor Co. and Messrs. Bell and Roberts of the Packard Motor Car Co.

#### Ablest Men Concentrated on Engine

"No abler men on engines and motors exist in the industry and it was clear that by devoting their entire time solely to this engine and by avoiding interferences with their efforts, we were adopting the very best possible method of securing quick and reliable results. Resulting production, which will be hereinafter detailed, demonstrates that this course of action was the proper one to be followed.

"The same method of concentrating authority was applied to other engines, including:

Hispano-Suiza .....	150 hp.
Hispano-Suiza .....	180 hp.
Hispano-Suiza .....	300 hp.
LeRhône .....	80 hp.

"During July, 1917, the Signal Corps had purchased a miscellaneous assortment of small engines which could be secured in this country, none of which proved of any substantial benefit.

#### Monthly Engine Production

"Real production began in August, 1917. The following table shows the total production of engines by months from that date to the present time:

1917	
July .....	66
Aug. ....	139
Sept. ....	190
Oct. ....	276
Nov. ....	638
Dec. ....	595
Jan., 1918 .....	705
Feb. ....	1004
March .....	1686
April .....	2214
May .....	2517
June .....	2604
July .....	3151
Aug. ....	3625
Sept. ....	3801
Oct. ....	5297
Nov. ....	3305

Total ..... 31,813

#### Types of Engines Produced

"The production of engines as to types is as follows:

OX-5 .....	8412
Hispano-Suiza .....	4101
LeRhône .....	1178
Lawrence .....	451
Gnome .....	280
A-7-A .....	2250
Bugatti .....	11
Liberty .....	15,131

Total ..... 31,814

"The total amount of horsepower produced up to Nov. 22, 1918, is as follows:

OX-5 .....	757,080
A-7-A .....	225,000
LeRhône .....	94,240
Hispano-Suiza 150 .....	532,350
Hispano-Suiza 180 .....	97,920
Hispano-Suiza 300 .....	2,400
Liberty .....	6,052,400
Bugatti .....	4,400
Lawrence .....	10,824
Gnome .....	30,800

Total horsepower ..... 7,807,414

"The results achieved by the Liberty engine were so satisfactory to the Allies that commencing June, 1918, they were very insistent in placing with us large orders for engines. It soon became apparent that we would need additional sources of engine supply over and above the 22,500 which was originally planned for our own Army and Navy.

#### 5603 Engines Produced in October

"We, therefore increased the number of manufacturers by adding the three plants of the Willys-Overland Co. at Elmira, Elyria and Toledo, and also the Olds Motor Co. at Lansing, Mich., to the list of Liberty producers. We also placed orders for 8000 8-cylinder Liberty engines with Willys-Overland and the Buick Motor Co. at Flint, Mich. When this was completed we had placed orders for engines as follows:

OX-5 .....	9,450
A-7-A .....	2,250
Gnome .....	342
LeRhône .....	3,900
Lawrence .....	451
Hispano-Suiza 150 .....	4,000
Hispano-Suiza 180 .....	4,500
Hispano-Suiza 300 .....	10,000
Bugatti .....	2,000
Liberty 12 .....	51,100
Liberty 6 .....	8,000

Total ..... 95,993

"Our production of engines of all types during October was 5603 of which 3878 were Liberty 12-cylinder. Under the above increased contracts we would have produced during January, 1919, 8000 engines per month which would have increased during the succeeding 4 months to a production of 10,000 engines per month.

#### Rolls-Royce Production

"The best known engine which is comparable to the Liberty is the Rolls-Royce, which is the most prominent English engine. Our advice last summer from the English authorities was that the largest weekly production of Rolls-Royce engines had been 59 and that the average weekly production was 45 engines. It will be noted that during the month of October, we were producing over 150 Liberty 12-cylinder engines per working day.

"The Rolls-Royce engine develops approximately 100 hp. less than the Liberty and weighs approximately 100 lb. more than the Liberty.

"During the month of October we produced of all types of engines a total of 5603. This is more than the total production of France and England during

one month during the four years of the war.

"By following the foregoing method of production, we have achieved the following results:

"1. Designed, developed and put into production during 1 year a 400 hp. type of perfectly satisfactory performance.

"2. Designed, developed and produced within 18 months over 15,000 of these engines.

"3. Produced during 18 months engines of all types totalling 31,814.

#### Liberty Engine Versus Foreign Type

"No production of a foreign type of engine would have produced any corresponding result. The difficulties, troubles and delays would have at least equalled those experienced on the Liberty, and the result would have been much less satisfactory.

"That the result has been satisfactory is apparent from the entire course of aviation during the past few months, which is illustrated by the three following incidents:

"1. The English aviation authorities cabled in June, 1918, that the Liberty engine test had shown it to be a satisfactory aviation engine, and that it was America's greatest contribution to the aviation activities of the war.

"2. Count Poiniatowski, who is the official representative in this country of the Hispano-Suiza Co., stated that Mr. Birkgit, who is one of the leading French aviation engineers, after examining the first 3 Liberty engines sent by us to France, stated that they excelled any engine of that type or size which had been developed in France.

#### Most Satisfactory Engine Available

"3. The experience of the aviators on the front and their opinion of the Liberty engine as given to us by Major Brett on his return from France is that it is the most satisfactory engine to operate that was available to them.

Accessories were discussed by various Army officers as follows:

"The guns on an airplane include a fixed machine gun in front which is aimed by pointing the entire plane and, in case of a two-place machine like the DeHaviland 4, the gunner in the rear has flexible machine guns which he can aim in almost any way.

"These guns are special, different from other machine guns, and to a large extent require special ammunition. There is almost no part of the entire armament equipment of an airplane that is not special.

#### Marlin Forward Gun

"After the declaration of war, the only quickly available arm for the fixed forward gun was the Marlin type. The Browning had not yet been developed; therefore, the Marlin was adopted and has been eminently satisfactory, and, in fact, equals the very best on the front.

"The synchronizing of the gun, that is to say timing the shots from the engine, so that the shot would fire through the

propeller without striking its blades, is a problem never before solved for the Marlin gun and it was necessary to develop the synchronizing device, which permits firing the shots through a propeller revolving at speeds varying from 600 to 1650 r.p.m.

#### Mounting of Gun Complicated Problem

"The mounting of the Marlin gun, including provisions for ammunition, discharge of the empty shells and discharge of the disintegrating steel belt, was in itself a complicated problem.

"For the flexible gun shown on the rear cockpit of the DeHaviland 4, the Lewis gun, the only machine gun not using a bolt, was adopted. This involved re-designing the gun to take U. S. ammunition, increasing ammunition capacity 47 to 97 rounds per container, and part of the problem of the flexible mounting which is before you.

"The gun sights, involved special lenses, previously made in Germany. The development of optical glass in this country is a story by itself.

"The greatest credit is due to the engineers of the Ordnance Department of the Savage Arms Corp. and of the Marlin-Rockwell Corp. for the wholehearted way in which they at their own expense as far as the latter two are concerned, conducted experiments night and day to solve these problems.

#### Airgun Production

"The production question involved in developing from nothing two types of aircraft machine guns to actual shipments in less than 12 months of about 30,000 Lewis flexible type and 35,000 Marlin fixed type is worthy of note.

"The fact that special ammunition is required for aircraft service should be remembered. The special cartridges include armor-piercing, incendiary bullets and tracer bullets, the latter showing a trail of smoke in the air indicating to the gunner the direction of fire.

"Much public discussion is heard of bombing from airplanes. The DeHaviland 4 machine shown may be used as a day bomber. The various bombs and bomb dropping devices are shown at the side of the room.

#### Various Types of Bombs Employed

"Demolition bombs used to destroy permanent structures are made in sizes varying from 50 lb. to 1000 lb.

"Fragmentation bombs are for use against troops. They explode just above the ground and send small fragments in all directions.

"Incendiary bombs are made in two forms: One to scatter small burning particles over a large area, the other for a more concentrated flame.

"Parachute flares are a form of bomb used to light the target in night bombing. They are interesting, as they contain a complete parachute which supports a flare to drop slowly after the explosion of the bomb, and shed a brilliant glare of light.

"The instrument equipment involved a great variety of problems.

"The self-luminous radium dials required for practically all instruments immediately became a production problem.

"How the General Electric Co. in 8 weeks time was producing 250 airplane compasses per week and how the minute chains in the aneroid barometers which serve as altimeters were secured from Switzerland, how the air speed indicators are all calibrated in a wind tunnel and how the National Cash Register Co. developed the tachometer are each stories of absorbing manufacturing interest.

"At the outbreak of the war in 1914 aerial photography for military purposes was a new subject; no special camera equipment was available, neither was the equipment for developing and finishing negatives in the field with the extreme rapidity demanded.

#### Initial Aerial Photography

"The first aerial work was done with cameras held in the hands. These were quickly replaced by cameras attached to the side of the planes, and later working through the bottom of the fuselage.

"The later development consisted of cameras supplied with plate magazines. The power to operate these magazines was furnished from a small windmill.

"This general line of development went on to an automatic camera, which could be put in action by the pilot and given no further attention during a reconnaissance, leaving the pilot free to fly and fight.

"Further development included a film camera for long range reconnaissance work.

#### Cameras Are Developed

"At the outbreak of the war it was possible for the aerial photographer-observer to fly at low altitudes, but as the importance of photography increased the enemy were more aggressive in bringing down photographic observers. This fact greatly increased the altitude from which photographs could safely be taken, and it was frequently necessary to make exposures from an altitude of 17,000 ft. This increase in altitude required lenses of longer focus and a number of cameras having 50 in. lenses were employed.

"Long experience in interpreting photographs has made possible the location with absolute accuracy of concealed batteries, machine gun nests, barbed wire, and even the paths followed by the soldiers.

"The development of cameras and photographic equipment to get these really marvelous photographic results involved the most extensive optical, chemical and mechanical research work. Much of this had been carried to a high degree of perfection by our Allies, who sent the very best men they had to this country to aid in initiating the work in the United States.

#### Development of Radio Apparatus

"Prior to the outbreak of hostilities in August, 1914, radio apparatus had not been used to an appreciable extent on airplanes. The development of suitable radio telegraph apparatus was under-

taken and this method of communication soon became extremely important and valuable in fire control work, where observation planes are used to correct the firing of long range artillery. At the time the United States entered the conflict satisfactory radio telegraph apparatus was in use by the combatant forces. Enormous improvements have been effected, however, by the Signal Corps and the Air Service of the United States, in apparatus designed for fire control telegraph signals. The sets which have been made and supplied in thousands to the American Expeditionary Forces are far superior to any apparatus developed by the other nations at war.

#### Radio Telephone

"In April, 1917, the radio telephone for airplanes was in much the same state of development that the radio telegraph was in August, 1914. The airplane wireless telephone is by far the most striking method of using radio communication on airplanes.

"By means of this device the commander of an Air Squadron can direct by voice the movements of the entire group of airplanes under his command, thereby making the Air Squadron a real military unit. The recent developments in aero fighting abroad indicate the inestimable value of this ability to command the units of a squadron.

"Among other uses for the radio telephone is the communication which can be had between airplanes and ground by telephone, which may become of enormous importance in future use of aircraft. A pilot could thereby talk directly with a general, without intermediate delay and confusion.

#### Radio Compass

"A different type of apparatus recently developed enables the observer in an airplane to locate by means of radio signals sent from a land station his position with reference to certain fixed points. The observer can therefore direct the flight of the airplane in any predetermined manner by means of this radio compass. The uncertainty attached to the use of the magnetic and gyroscope compasses for airplanes makes the use of the radio compass a practical certainty.

"The problems encountered in working out suitable airplane radio apparatus have been principally eliminating the overwhelming effect of the noise of the motor; the reduction of weight to the smallest possible value; the necessity of absolute freedom from fire hazard; simplicity which would enable fliers untrained in the use of radio apparatus to operate the same, and eliminating the vibration of apparatus in the airplane.

#### Maintenance and Care of Fliers

"One of the most important works undertaken by the Department of Military Aeronautics has been the maintenance and care of fliers. This endeavor has been carried on under the direction of Brig. Gen. T. C. Lyster through the Medical Section of the Department of

Military Aeronautics. The most important device for maintaining the health and efficiency of the flier is the oxygen apparatus which is designed to feed oxygen to the personnel of planes and maintain at all altitudes proper atmospheric conditions.

#### Fliers' Fatigue Cause of Most Deaths

"The great necessity of efficiently maintaining fliers was brought about through a study of the English air casualties during the first year of the war. These were about as follows: Two per cent due to the Hun; 8 per cent due to the plane, and 90 per cent due to the men, which clearly indicated that something was radically wrong with the personnel, and immediate action was necessary. A thorough study of this situation disclosed the fact that practically all of the flying personnel was suffering from what was known as oxygen fatigue or lack of oxygen being caused by flying so many hours of the day at high altitudes and not securing enough oxygen to properly feed the body.

#### Oxygen Equipment

"To design an oxygen equipment which would be entirely automatic, one that would be reliable and efficient, necessitated the building of a device which embodied several instruments and one that would overcome many variable conditions.

"It was necessary to have a device that would work under variable tank pressures from 100 lb. to 2250 lb. per square inch with a temperature range of from 70 deg. to 80 deg. F. to 20 deg. or 30 deg. below zero. To overcome these variables necessitated a very thorough study of temperature and pressure effects upon metals and considerable experiment. In addition the apparatus must deliver the required quantity to either one or two men at every altitude from 3000 to 30,000 ft.

"The first apparatus was designed for the British Air Service by Lieut.-Col. Droyer of the British R. A. M. C., and was made at the plant of DeLestang at Paris. The demand for this apparatus was so great that an automobile was kept waiting at the plant for each apparatus as it was finished and was especially rushed to the front.

"An indication of the importance of oxygen is shown by the record of the Twenty-fifth Squadron, Ninth Wing, R. F. C. This was the first squadron to use oxygen equipment on planes in the British service. They were using the original Droyer apparatus and found it efficient, sufficiently at least for Major Birley, who was in charge of the squadron, to state that this squadron, in his opinion, was giving six times the service of any other British squadron.

"An original model of the French-made apparatus was brought to this country to start quantity production. The French apparatus was a hand-made device, each part being carefully fitted by an individual workman. Under the direction of Brig.-Gen. T. C. Lyster, Medi-

cal Research Board of the Medical Section of the Department of Military Aeronautics, and the Bureau of Aircraft Production, the development and engineering of an oxygen apparatus to meet American requirements and to be adapted to American methods of manufacture was undertaken.

"The entire apparatus had to be redesigned, first, to take care of two men instead of one; second, to reduce the weight; third, to meet American methods of manufacture, and fourth, to make the apparatus more efficient and reliable. This work was started about the first of January, 1918.

#### Oxygen Equipment Division Established

"On May 3, 1918, six complete equipments, including apparatus, tanks, masks, etc., were sent overseas by special messenger to be actually tried out on the front. On May 31 the first production shipment of 200 apparatus was made. To date over 5000 have been manufactured and accepted by the Government, over 3600 have been shipped to ports of embarkation and over 2300 have been floated overseas, this production ranging from a rate of about 400 per month in May to 1000 per month in October.

"The importance of oxygen equipment necessitated the establishing overseas of a special oxygen equipment division to take care of the application of these equipments on planes.

"All military planes flying over an altitude of 10,000 ft. are equipped for the application of oxygen equipment. The following type of planes all use oxygen equipment: Day bombing, pursuit and chase planes and a percentage of both night bombing and Army and Corps Observation, this percentage depending on the altitude at which these types of planes will fly."

#### Aero Mail Aerodrome for Philadelphia

PHILADELPHIA, Nov. 29—In an address before the Engineers Club of Philadelphia Charles N. Knight, superintendent of the aero mail division of the Philadelphia post office, said that Philadelphia, or some nearby point in the State, is expected to be selected as the site for an aerodrome that will cover 100 acres.

#### Panama Business Conditions

WASHINGTON, Nov. 29—Panama, which imported \$63,000 worth of automobiles, \$64,000 worth of automobile supplies, \$60,750 worth of automobile tires and \$89,000 worth of gasoline from the United States in 1917, is reported to be suffering from dull business by the American Consul General there. The condition is due to the temporary stoppage of merchandise from the United States, which would indicate that the return to peace times may find a demand for automobiles from that country. The investment of much capital is not advised under the present conditions. General agricultural interests have attempted little or no development.

## *"Red Seal Continental Motors are giving fine service overseas"*

There is probably no motor which has had its worth more conclusively demonstrated than the Red Seal Continental Motor.

Here at home, for well over a decade, it has been put to the test in hundreds of thousands of trucks and automobiles—in vehicles of every weight and every type, under every conceivable condition of service. Today it is in use in one or more models of over 160 separate makes of trucks and automobiles.

And now, added to the splendid peace-time record of this famous motor, is its equally splendid showing under the severe test of war service. On the shell-torn roads of France it has proved itself as big as its job.

*Past Performance is the surest and most dependable evidence of motor worth. It is only when you select a truck or car on this basis that you are insured against motor experiments of doubtful value.*

Performance has proved the Red Seal Continental Motor. Its record assures you 100% motor value. Now, as always, this motor is *dependable*.

Look for the Red Seal on the motor in the truck or car you buy—and *be sure*.

## Details of the Liberty Engine

First Mechanical Description, Illustrated with Sectional Drawings, Published in the Periodical Press—Same Engine with Cast Cylinders Used for Tanks

By J. Edward Schipper

**I**N spite of opposition during the first months of its production, the Liberty aircraft engine lately has been accepted as representing the highest class of engineering design. A strict censorship has been maintained over its details of construction, though the main specifications have been widely known for some time. It is, therefore, with unusual interest that the drawings, published herewith for the first time, will be scanned by engineers whose interest has been aroused but whose connections have not been such as to permit them to view the prints.

The Liberty engine, used in the DeHaviland and other land planes and a great number of seaplanes, is a 12-cylinder V-type with overhead valves and overhead camshaft. It has individual drawn steel cylinders with cylinder dimensions of 5 x 7 in., giving a piston displacement of 1649.34 cu. in. The cylinders are bolted to the upper half of the aluminum crankcase, the two sets making an angle of 45 deg. with each other. The waterjackets are of pressed steel and are welded to the cylinders and at their own seam. An engine in all respects identical with the Liberty aircraft engine, but having cast iron cylinders, is fitted on "tanks," and one of the sectional views printed herewith shows this design.

The valves are mounted in the heads of the cylinders and are inclined at an angle of 15 deg. to the centerline of the cylinder, so that the angle made by the centerlines of the two valves is 30 deg. The

intake manifold passes between the two rows of cylinders, and the carbureters in most of the installations are mounted in the V. The entire valve drive is housed above the cylinders and can be readily removed without tearing down the engine.

### Weight and Output

The weight of the Liberty engine is approximately 806 lb. and the brake horsepower developed ranges anywhere between 350 and 400 in the army type with the high compression pistons (18 per cent) and 320 to 340 in the navy type with the low compression pistons (20.5 per cent). The center of gravity of the engine is on the centerline of the transverse section, 10 in. above the top of the engine supports and 21/32 in. toward the distributor end of the engine from the center of the middle bearing bolts. The rated fuel consumption is .54 lb. per brake hp.-hour or 36 gal. per hour with wide open throttle at 1700 r.p.m. Under service conditions, about 30 gal. per hour is a fairly representative consumption. The oil consumption is .03 lb. per hp.-hour or 1½ gal. per hour with wide open throttle at 1700 r.p.m. The horizontal flying speed of the engine is 1700 r.p.m. and the ground speed is 1600 to 1625 r.p.m.

The pistons are of aluminum. There are two designs of pistons used, one for the army type and one for the navy. The army type pistons have a crowned head which gives an 18 per cent compression space. The navy type pistons have a flat head which gives a 20.5 per cent compression space. The pistons are 5 in. in length and have 3 rings of the eccentric type.

*Released by courtesy of the Bureau of Aircraft Production.*

all at the top of the piston. These piston rings are assembled with a gap between the ends of the rings not less than .025 in. The pistons weigh 3 lb. 3 oz., and the number of ounces that the pistons weigh over 3 lb. is stamped in the depression on the side of the piston so that in assembly it is possible to pick out pistons of similar weight. The piston casting has an unribbed section and is fairly heavy, the section being  $\frac{1}{2}$  in. thick at the head and at the rings and tapering to  $\frac{1}{4}$  in. at the end of the piston skirt.

I-beam connecting rods are used, the connecting rod length being 12 in. between centers. The piston pin is a seamless steel tube, the tube being a drive fit into the bosses on the aluminum piston. The tube is of  $1\frac{1}{4}$  in. outside-diameter and is surrounded by a bronze bushing, upon which the upper end of the rod bears. The rod has a solid head and its lower end is either solid or forked, depending on whether it is for the left or right cylinder. The left rods are forked and the right plain. In assembly, the connecting rods are stamped with the serial number of the crankshaft to which they are fitted and also with the number of the cylinder in which they belong. In this way, it is possible to reassemble the Liberty engine and be certain that the rods are returned to the proper cylinders.

The clearance between the lower connecting rod bushings and the crank pin varies from .003 in. to .004 in. The allowable end play is from .010 in. to .020 in. The plain rods have two cap bolts and the forked rods have two for each side, or four.

### Bearings Between Halves of Case

A drop-forged seven-bearing crankshaft,  $2\frac{5}{8}$  in. in diameter, is used. The shaft carries a propeller hub at its forward end and at the rear end carries a bevel gear for driving the valve mechanism. A double row thrust bearing at the propeller hub end of the crankshaft takes the end thrust on the shaft. The shaft is drilled

*Cross section through lower half of crankcase*

for oil passage, the openings being drilled through the crank cheeks through the crankpins. The propeller hub is lapped to a fit on the shaft, the end of the crankshaft is tapered and when the hub is fitted on it should be about .001 in. tighter at the large end of the taper than at the small end. In addition to the taper fit, there is a key in the end of the crankshaft to take the propeller hub.

The crankcase is in two pieces, both of which are aluminum castings. The crankshaft bearings are on a line with the split in the crankcase, the lower halves of the crankshaft bearings being held in the lower half of the crankcase and the upper halves in the upper half of the crankcase. The two halves are tied together by long bolts or studs which pass through the upper half of the crankcase, through bosses, the nuts being at the top of the upper half of the case. This gives an accessible construction which is at the same time rigid. A careful joint is made between the two halves of the crankcase in order to secure the desired alignment at the main bearings, the joint being lapped.

### Valve Gear

The valve drive is arranged as follows: From the bevel gear on the end of the crankshaft motion is transmitted to a vertical shaft located on the distributor end of the engine, or the end opposite from the propeller hub. This shaft has an intermediate gear which engages with the two cam driving shafts running parallel with the centerlines of the cylinder blocks. The vertical shaft which carries the lower bevel gear and the intermediate gear is carried on a single row ball bearing at the upper end and a single row ball bearing just above the bevel gear at the lower end. The camshaft driving shafts are carried on two single row ball bearings at their lower end and in a bronze bushing at the upper end.

The drive is taken from this point to a bevel gear on the end of the camshaft which actuates the valves. The

Oil pump, oil  
strainer and  
relief valve

Two views of the water pump

camshaft assembly consists of a camshaft with the cams integral, the camshaft bearing, camshaft driving gear, rocker levers, camshaft housing together with the covers, and also the camshaft driveshaft with the gear, bearings and camshaft driveshaft housing. The two camshaft assemblies for the left and right rows of cylinders are identical and are interchangeable, with the exception of the camshafts themselves and the camshaft housing covers. Each shaft is stamped with a serial number on the soft plug in the end of the camshaft opposite the flanged end. The right hand shafts are marked R and the left hand shafts are marked L. The housing covers are machined in place on the housing.

The valves are operated from the camshaft by means of roller cam followers which actuate the rocker shaft and in turn the valve rocker arms. The valve rocker arms bear directly on the valve stems by means of an adjusting bolt directly on the ends of the valve stems. The valves are set into the cylinders on an angle of 15 deg. to the centerline. The valves are the standard mushroom type with 45 deg. seat. The cylinder heads are bushed for the valves and the valve springs are of the double concentric type. The adjustment for the clearance between the end of the valve stem and the valve pushrod is made by turning the screw in the end of the rocker or pushrod and then locking it by means of the nut on the top of the rocker. This nut is locked by a cotter pin and is a castellated type. The clearance on the exhaust valve is .019 to .021 in. and on the inlet, .014 to .016 in.

### Ignition System

The distributor is mounted on the ends of the camshaft and arranged to fire 1L, 6R, 5L, 2R, 3L, 4R, 6L, 1R, 2L, 5R, 4L, 3R. The ignition system used on the Liberty 12 is the battery type with two independent breaker and distributor mechanisms, identical in every respect and each one firing all 12 cylinders. These distributors are supplied with electrical energy from two sources. For starting and idling speeds up to 650 r.p.m. current is drawn from the specially constructed four-cell storage battery which has sufficient capacity to

ignite the engine at full speed for three hours and is so constructed that it will function properly upside down. The generator builds up so that it takes up the load at 650 r.p.m.

Two main circuit breakers connected in parallel are located in each distributor box and the two circuit breakers are timed to operate simultaneously. Circuit breakers are provided in duplicate as a precautionary measure. There is also an additional circuit breaker to prevent the production of a spark when the engine is turned backward or rocked. The auxiliary breaker is connected in parallel with the other two through a resistance unit which reduces the amount of current flowing through it. The breaker is so timed that it opens slightly before the other two when the engine is turned in a forward direction. When the engine is turned in a backward direction, the main breakers open first and no spark is produced, because the auxiliary breaker permits the current to continue to flow through the coil but in diminished quantity, owing to the resistance unit. The distributor shaft is carried on two ball bearings.

The generator is driven from the same vertical shaft which drives the two camshaft driving shafts, the drive being taken off the upper end of this shaft. The generator rests in a vertical position above this shaft on the centerline of the engine between the two rows of cylinders. By simply removing one flat head screw the entire generator driveshaft assembly can be lifted out. The mesh between the lower generator driveshaft gear and the crank gear is adjusted by pins between the

Sectioned view of water pump

bearing container at the top of the shaft and the crankcase.

The oil supply for the Liberty engine is carried in a reservoir which is cooled. This reservoir is mounted somewhere in the vicinity of the engine and from it oil is led to the connection on the right side of the oil pump body, which is marked in raised letters Oil In. The oil is filtered at this point through a large-area, fine mesh screen. A delivery pump of the gear type takes the oil after it has passed through the screen and delivers it under pressure to a distributor pipe running the entire length of the crankcase. There is a pressure regulating valve between the pump and the distributing pipe which holds the pressure so that it does not exceed 50 lb. per square inch.

From the distributor pipe there are pipes fitted in the crankcase leading to the main crankshaft bushings. The crankshaft is hollow, and in the center of each main bearing there is a radial hole drilled through the shaft into the hollow center. A passage leads from each hollow main bearing to the adjacent crankpin, which is also hollow. A radial hole is drilled through each crankpin and carries the oil out on the surface of the pin. There are oil grooves and passages in the connecting rod bushings to insure proper lubrication for both the forked and plain connecting rods.

### Lubrication of Piston Pins

The oil spray thrown off by centrifugal force from the ends of the connecting rods lubricate the piston pins and cylinder walls. A part of the oil conducted to the crankshaft main bearing at the propeller end of the engine goes through a passage around this bearing and

up through pipe leads to the propeller end of the camshaft housings. From the end of the camshaft housing it is led around the end of the camshaft bearing through a passage drilled diametrically through the bearing midway of its length. Once every revolution of the camshaft, a hole drilled through the camshaft into its hollow center registers with the oil passage through the bearing.

### Lubrication of Valve Mechanism

Thus once every revolution of the camshaft a small quantity of oil is forced into the hollow camshaft. The oil is led through the camshaft and out through holes drilled in it to each camshaft bearing. The excess works out at the ends of these bearings and collects in small pockets to a depth of about  $\frac{1}{4}$  in. The cams, in revolving, dip into this oil and splash it over the cam rollers and into pockets in the rocker level shafts. From these pockets it is led through the hollow rocker shafts to the rocker shaft bearings.

The excess oil eventually finds its way to the gear end of the camshaft housings, over the gears and down the driveshaft housing into a chamber just above the oil pump.

The excess oil thrown off in the crankcase by the connecting rods collects in this same chamber when the engine is inclined so that the propeller end is high. If the propeller end of the engine is low, this oil collects in a small sump or chamber at the propeller end of the crankcase.

Immediately above the oil delivery pump is located an oil return pump consisting of three gears, and driven by the same shaft as the delivery pump. The function of this oil return pump is to draw the excess oil out of the crankcase and return it to the oil reservoir. One section of this pump draws oil from the sump at the propeller end of the crankcase and the other section draws oil from the sump at the distributor end of the crankcase. Both halves of the pump deliver oil to the connection on the left side of the oil pump body marked Oil Out, from which point it returns to the oil reservoir.

### Cooling System

Cooling water is circulated through the Liberty engine by means of a centrifugal pump running at one and one-half times engine speed. The capacity of this pump is 100 gal. per min. at 1700 r.p.m. The cooling system from the pump inlet to and including the water outlet header will hold  $5\frac{1}{2}$  gal. of water.

The water pump is provided with a single inlet, the outside diameter of which is 2 in., and two outlets each one delivering water to a header, the two headers supplying the right and left hand cylinders respectively. Water is forced into each cylinder jacket in a tangential direction. This construction gives the water a whirling motion inside the jacket and insures uniform cooling.

The water outlet pipe for each cylinder extends inside the jacket to a point very close to the exhaust valve chamber, which assures proper cooling of the exhaust valve. The cooling water then passes through a passage cored in the intake headers. This serves to warm and further vaporize the incoming gas as well as to assist in cooling the water. These passages in the intake headers are connected by two water outlet headers, the final outlet of which has an outside diameter of 2 in.

The water pump is driven from a vertical shaft which takes its drive from the same vertical shaft that drives the camshaft driveshafts and the generator. This shaft extends downward and has a bevel gear which meshes with a bevel gear on the end of the pump shaft, thus accomplishing the drive. The vertical shaft extends downward and terminates in the oil pump, carrying the

Connecting rod assembly in side view and section

Detail of crankshaft, showing method of plugging bores

driving gear of the gear type of pump utilized for this purpose.

Two duplex Zenith carbureters are used on the 12 cylinder Liberty aircraft engine. This is equivalent to four single carbureters, each one supplying three cylinders of the engine. Each duplex carbureter consists of a single float chamber and a single air inlet joined to two separate and distinct spray nozzles, venturi and idling devices. (As the V type engine is, in a sense, two separate engines, joined together for greater utility, so the Zenith is built in double form for the purpose of

supplying each one of these two engines with its exact requirements.) Each of the two barrels of each carbureter is fitted with a throttle valve of the butterfly type. The shafts of the throttles are parallel with the centerline of the engine, or "fore and aft," and are interconnected by means of gear sectors pinned to the throttle shafts and meshing together. The two pairs of throttles are operated simultaneously by a shaft, provided with an adjustment at each end by means of which the pairs may be synchronized. Each duplex carbureter is fitted with an altitude adjustment which affects both barrels equally.

# Business Would Be Free to Develop

Desire for Elimination of Burdensome Restriction and Assistance in Building Foreign Trade Keynotes of Reconstruction Conference—Shape 27 Policies for the Guidance of Business

**A**TLANTIC CITY, Dec. 6—American business has indicated the course it would like to pursue in the work of readjusting from a war to a peace basis. At the Reconstruction Conference of War Service Committees of the Chamber of Commerce of the United States here during four days of this week 5000 representative business men adopted twenty-seven resolutions, which are intended to shape and guide the machinery of transition.

Business wants to be free of burdensome restriction. It wants the privilege of holding its own rudder and steering the course that its own experience indicates is the wisest one. And a good part of that course, it is planned, will take American-made goods in American ships to foreign ports.

The convention, representing the allied War Service Committees of some 381 different industries, marks an era in the economic progress of the country. Here were 5000 of the biggest business men of the country gathered together to talk over their past troubles and problems, and to devise ways and means of grasping the trade possibilities that are unfolding with the passing of the world war.

Again and again the delegates heard from those who are in a position to know that business faces a period of great prosperity, that opportunity is knocking at every trade door.

Never before has there been gathered together the business ability and the brains of business that

was drawn to the City by the Sea for this four-day conference. Every session was packed. Interest never flagged. Time and again the delegates rose to their feet and cheered when some speaker touched a responsive chord.

The time has come, it is believed, when the need for restrictive measures has passed, and that business is its own best counsel in developing after-the-war trade. As was told in *AUTOMOTIVE INDUSTRIES* last week, Harry A. Wheeler, president of the congress, uttered the keynote of the conclave:

"Men of business may not be regarded as competent advisors in matters of diplomacy and statecraft as affecting political reconstruction, but as a corollary to this assumption, the diplomat or statesman may not be regarded as a wholly competent advisor in matters of economic reconstruction." The conference cheered that statement.

The matter of foreign trade was an absorbing topic of discussion, and it is significant of the trend of thought that of the twenty-six resolutions unanimously adopted by the conference, nine, or one-third, had to do directly with this subject.

All the resolutions were adopted unanimously. They represent the essence of the American business man's experience during the time the United States was in the war and are intended to be the guiding spirit for American business in the months to come. Here they are:

## The Guiding Spirit of American Business

Resolutions Unanimously Adopted by the Reconstruction Conference of the Chamber of Commerce of the United States

**1—Cancellation of War Contracts**—It is in the public interest that all war orders placed by any contracting agency of the government and accepted in good faith, whether formally and regularly executed or not, should, upon cancellation by such contracting agency, be promptly and equitably adjusted and satisfied as if every formality had been observed, and when so adjusted the amount ascertained to be due by the government should be promptly paid to the end that these funds may be utilized by the industries of the country to speed their transition from a war to a peace basis.

If it should be ascertained that legislation is necessary or desirable to accomplish this end, Congress should forthwith enact such legislation.

Officials dealing with questions of adjustment on account of war orders must necessarily be familiar with all the conditions affecting the order. It will greatly promote expedition and the interests of both the government and private enterprise for the officials who made the contracts to remain in the government service to participate in the readjustments.

**2—Surplus Government Supplies**—Under date of Nov. 29,

1918, the Secretary of War issued a public statement, i. e., "To prevent too violent dislocation of industry from the standpoint of both employee and employer, accumulation by the War Department of either raw material or finished product will be distributed when and where liquidation of such supplies will least interfere with the return of industry to normal condition." Such action would seem to insure the stability of the industries affected which fully appreciate this liberal position.

Therefore the War Service Committees of American Industries hereby tender to the War Department their services for their respective industries for the purpose of advising with and assisting the War Department in the disposition of such materials.

**3—Removal of Restrictions of Industry**—It is in the public interest that all war regulations of industry should be revoked and all war restrictions on industry should be removed as speedily as practicable, save such industries as are engaged in the production, preparation or distribution of foods, feeds, and fuel and such last named group of industries

should be freed from war regulations and restrictions as early as consistent with the welfare of this nation and of the Allies.

**4—Pivotal Industries**—Conditions brought upon us by the European war at its beginning, as well as our national necessities after we entered the war, made it of the highest importance that a number of industries should at once be developed in the United States. Large investments, both of capital and skill, have since been placed in these enterprises. Upon the production of some of them, relatively small in themselves, the continuation of some of our largest industries has depended. Some of the recently developed industries have national importance in fields much broader than the markets of their products; for they may serve, for example, to promote scientific research, which will add to national efficiency, resources, and wealth in many distinct ways.

It becomes essential, therefore, that the government should at once proceed to ascertain the industries which have been developed during the European war and ascertain those the maintenance of which is indispensable for the safety of our industrial structure and our military establishment.

When these pivotal industries have been ascertained, means suitable in view of their nature, and situations should at once be provided for their encouragement and preservation.

**5—Industrial Co-operation**—The war has demonstrated that through industrial co-operation great economies may be achieved, waste eliminated, and efficiency increased. The nation should not forget, but rather should capitalize these lessons by adapting effective war practices to peace conditions through permitting reasonable co-operation between units of industry under appropriate federal supervision. It is in the public interest that reasonable trade agreements should be entered into, but the failure of the government to either clearly define the dividing line between those agreements which are, and those which are not, in unreasonable restraint of commerce, or to provide an agency to speak for it on application of those proposing to enter into such agreement in effect restricts wholesome co-operation and deprives both industry and the general public of its benefits. The conditions incident to the period of readjustment render it imperative that all obstacles to reasonable co-operation be immediately removed through appropriate legislation.

**6—Federal Trade Commission**—The Federal Trade Commission was advocated by the President, and was created as an agency to make the administrations of our trust legislation explicit and intelligible, and to provide "the advice, the definite guidance and information" which business enterprises require. The normal importance of the commission's task is now tremendously increased by the imperative need for whole-hearted and sympathetic co-operation between the government and industry especially during the readjustment period and suggests the desirability of the two existing vacancies in the commission's membership being promptly filled with able men of broad business experience and clear vision prepared to assist actively in discharging these tasks along constructive lines.

**7—Industrial Relations**—The Convention heartily endorses in letter and spirit the principles of the industrial creed so clearly and forcibly stated in the paper read to it Thursday morning by Mr. John D. Rockefeller, Jr., and urges upon all units of industry—where they may not now be employed—the application of such principles. Without approving or rejecting his particular plan or machinery, the principles advanced by Mr. Rockefeller are as follows:

1—Labor and capital are partners, not enemies; their interests are common interests, not opposed, and neither can attain the fullest measure of prosperity at the expense of the other, but only in association with the other.

2—The purpose of industry is quite as much to advance social well-being as material well-being and in the pursuit of that purpose the interests of the community should be carefully considered, the well-being of the employees as respects living and working conditions should be fully guarded, management should be adequately recognized and capital should be justly compensated, and failure in any of these particulars means loss to all.

3—Every man is entitled to an opportunity to earn a living, to fair wages, to reasonable hours of work and proper work-

ing conditions, to a decent home, to the opportunity to play, to learn, to worship, and to love, as well as to toil and the responsibility rests as heavily upon industry as upon government or society to see that these conditions and opportunities prevail.

4—Industry, efficiency and initiative, wherever found, should be encouraged and adequately rewarded and indolence, indifference and restriction of production should be discountenanced.

5—The provision of adequate means for uncovering grievances and promptly adjusting them is of fundamental importance to the successful conduct of industry.

6—The most potent measure in bringing about industrial harmony and prosperity is adequate representation of the parties in interest; existing forms of representation should be carefully studied and availed of in so far as they may be found to have merit and adaptable to the peculiar conditions in the various industries.

7—The application of right principles never fails to effect right relations; the letter killeth and the spirit maketh alive; forms are wholly secondary, while attitude and spirit are all important, and only as the parties in industry are animated by the spirit of fair play, justice to all and brotherhood, will any plans which they may mutually work out succeed.

8—That man renders the greatest social service who so co-operates in the organization of industry as to afford to the largest number of men the greatest opportunity for self-development and the enjoyment by every man of those benefits which his own work adds to the wealth of civilization.

8—Relocation of Labor—The conversion of the industry of the country from a peace basis to a war basis involved a general and important dislocation of labor. This movement was gradual. The end of the war involves a much more rapid change in industry; while there will be a great demand for labor to meet the foreign and domestic requirements there may be for a time in special places a temporary condition of unemployment.

In the new relations of industry to labor we conceive it to be incumbent upon the community affected promptly to meet such conditions.

The local chambers of commerce should be able to contribute in an important way in this work.

9—Public Works—The development of public works of every sort, as recommended by the President, should promptly be resumed, in order that opportunities of employment may be created for unskilled labor.

10—Taxation—The cessation of hostilities brings to business interests a feeling of deep concern in the matter of taxation. The problems of readjustment are made more difficult through inequalities in the present law.

We believe, therefore, that in the consideration of amendments to the present act, or the passage of new revenue legislation, attention must be given to the views expressed by organizations of commerce and industry. Ability to pay, inventory values and proper reserves together with careful survey of the amount of revenue required under the new conditions are matters of vital importance to business interests of the nation during this readjustment period.

11—Inventories—We urge that Congress should give careful consideration to the grave menace now facing all industry due to the fact that both raw materials and finished goods are carried in full measure to meet the extraordinary requirements of the government and of the people, and that in large part the stocks have been acquired at abnormal cost and are therefore carried into inventories at inflated values, thereby showing apparent profits which have not been realized, and which probably will never be fully realized. These are largely bookkeeping or "paper" profits, and should not be used as a basis for taxation.

We therefore recommend that any tax law shall provide that during present conditions the taxpayer shall be allowed to make a deduction from his apparent profit by way of a reserve for a subsequent shrinkage in the value of merchandise.

We believe that the interests of the government can be protected against abuse of this privilege by the fixing of a maximum percentage of deduction to be allowed, and by the use of proper methods of inspection and appraisal.

**12—Railroads**—The Congress of the United States should speedily enact legislation providing for the early return under federal charters to their owners of all railroads now being operated by this government under federal regulations permitting the elimination of wasteful competition, the pooling of equipment, combinations or consolidations through ownership or otherwise in the operation of terminals, and such other practices as will tend to economies without destroying competition in service.

**13—Means of Communication**—We are opposed to government ownership and operation of telegraphs, telephones, and cables.

**14—Merchant Marine**—We recommend that the construction of a great Merchant Marine be continued and amplified, and that its operation under American control be kept safe by such legislation as may be necessary to insure its stability and its lasting value to American industries.

**15—Port Facilities**—The recommendations of the Port and Harbor Facilities Commission of the United States Shipping Board for development of ports are supported. Vessels of foreign register needed for our commerce by sea are attracted to those ports which are best fitted to coal, to load, and to unload cargoes, and thus provide means for a quick turnaround. After ascertaining the port facilities of European countries, and their plans for further development, the commission has recommended that there should be a local port commission at each of the important ports upon our coasts, that upon these commissions there should be representatives of industrial, commercial, and railroad interests centering at the port, that facilities should be installed to meet the needs of the port, and that a zone system should be arranged by which exports and imports would flow through those ports which are within economic transportation distance of the points of origin and destination. There should be co-operation with the Facilities Commission in its task of expanding means which will enhance the position of the United States among maritime nations.

**16—Public Utilities**—Public utilities have faced difficult problems, which have been accentuated by conditions arising out of war. The development and efficiency of such a utility as local transportation has immediate importance for every community. It is recommended that the Chamber of Commerce of the United States should appoint a committee to investigate and study the question of local transportation as it relates to the control of rates and service, franchises, taxes, the attraction of capital into the business, and such other questions as the committee may find pertinent. Such a committee should report its recommendations to the Board of Directors of the National Chamber, and the board should deal with them in accordance with the established procedure of the chamber.

**17—Water Powers**—Industrial activity is dependent upon the available supply of power. A bill which would effect the development of hydroelectric power upon waterways and lands which are subject to federal jurisdiction is now before a committee of conference between the two Houses of Congress. It is important in the public interest that Federal legislation on this subject should be enacted without further delay. We accordingly urge that the conference committee arrive at an acceptable form of legislation in season for enactment at this session of Congress.

**18—International Reconstruction**—In war we have made common cause with the Allies. We should likewise make common cause with them in seeking the solution of the immediate problems of reconstruction which they face, because of the efforts they put forth in the war. These problems peculiarly depend for their solution upon commerce.

Raw materials and industrial equipment which we possess the Allies urgently require, that they may reconstitute their economic life. We should deal generously with them in sharing these resources.

In order that we may share our materials with the Allies, we must also provide them with credits through which they may make the necessary payments.

Our ocean tonnage must supply our troops overseas and help to provision the inhabitants of war-devastated regions. The part of our ocean tonnage not required for these paramount needs, and vessels of associated countries which are in a

similar situation, should be entered into the common service of all nations. This common service should secure to all nations their immediate needs of food, raw materials, and transport for their products.

**19—European Commission**—The business men of the United States, having devoted their energies and resources toward the winning of the war, regardless of sacrifices or burdens, in support of the principles for which this country fought, appreciate the necessity of continuance of unremitting effort in order that the world may be restored to normal conditions as quickly as possible and the blessings of peace brought to all peoples.

In the accomplishment of these results the highest efficiency of the great commercial and industrial powers of our own country and that of the Allied nations will be developed only through co-operative effort and common counsel.

In order, therefore, to contribute to the fullest toward the prompt solution of the problem presented, the Chamber of Commerce of the United States is requested to enlist the co-operation of national bodies devoted to the extension and promotion of American commerce, and particularly foreign trade, in the appointment of a commission representative of American business, which shall proceed without delay to Europe and establish machinery for the following purposes:

**A**—To study at first hand the reconstruction needs of European countries in conjunction with business men of these nations in order to advise the business men of the United States as to how they may be most helpful in meeting the necessities of Europe and caring for the interests of American industry and commerce.

**B**—To be available to the Peace delegates of the United States for any needed information which they may be able to present or for any other aid which may be given by the business men of the United States through the medium of such a commission.

The Chamber of Commerce of the United States also is requested to appoint members of the commission to represent the business men of the United States at the forthcoming meeting of the Permanent Committees of the International Congress of Chambers of Commerce.

**20—Markets for Foreign Trade**—We strongly urge upon our government the vital necessity of encouraging and developing our foreign trade through all appropriate means possible, in order that the production of industry may afford employment to wage earners and prosperity to the nation.

**21—South American Relations**—It has long been the policy of this nation to cultivate relations of close sympathy with the nations of the western hemisphere as expressed in the Monroe Doctrine. We believe that these relations should be supplemented and strengthened by a vigorous development of our commerce and financial associations with our neighbors of North and South America.

The government's control of shipping should be brought to the accomplishment of this purpose as soon as it is consistent with other urgent needs, and the work of the Pan-American Union should be continued and broadened in scope.

**22—Property Rights in Mexico**—By provisions in a constitution adopted while much of the country was engaged in civil strife, and through subsequent legislation, Mexican authorities have threatened rights acquired by Americans in good faith, especially in minerals, including petroleum. Against threatened confiscation the American Government made formal protests. The attitude taken by the American Government is heartily commended as in accordance with obvious justice.

**23—Education for Foreign Commerce**—In the larger opportunities which are to be opened to American business men to play a part in the international commerce of the world the need will be felt for more men who are trained to a knowledge and understanding of the language, the business methods and the habits of thought of foreign lands. Complete success can only come to those who succeed in putting themselves into full accord and sympathy with the peoples with whom they are to deal.

We urge upon our industries that they take steps to provide opportunities to young men to obtain an education in the practices of overseas commerce and finance and in the practical use of foreign languages.

We call the attention of the various departments of government and of educators to the importance of this matter and ask that special efforts be made to supplement the valuable work already done and to open up every facility to the furtherance of a successful prosecution of this educational work.

**24—Forest Products Laboratories**—The Forest Products Laboratories, of the United States Forest Service, have rendered valuable service through scientific investigation of the physical properties of American woods and their adaptability for structural, industrial and ornamental usage. It is of great importance to American industry that the government should extend and adequately maintain the work of the Forest Products Laboratories.

**25—Cost Accounting**—It is the sense of this Convention that uniform cost accounting should be adopted by industries.

**26—Council and Executive Committee**—Your Committee has given serious consideration to the suggestion that following this conference an executive committee should be appointed to relate the efforts of the various war service committees, keep them continuously informed on matters of common interest, and co-ordinate their work on national problems.

It is the conviction of your Committee that it is absolutely essential to the stability of business in this country and the prompt and wise solution of our problems that the war service committees should continue their work in co-operation with government agencies and now turn their attention to the new questions with which the country is faced. We therefore recommend that all present committees so represent their industries and that an Executive Committee be named with as little delay as possible.

At the meeting of the chairmen of the war service committees held in Washington, D. C., on Dec. 12, 1917, the Chamber of Commerce of the United States was requested to undertake the organization of committees in all the industries not then represented.

By vote this conference also requested that the War Service Executive Committee of the National Chamber should act as the executive committee of these committees of the industries.

At the meeting in December, 1917, it was suggested to the War Service Executive Committee of the Chamber of Commerce of the United States that as soon as practicable a council be appointed representative of all the industries which would act as advisory to the War Service Executive Committee.

It is believed that the time has now arrived when such a council should be formed and it is recommended that this council be composed of the chairmen of the war service committees.

The Board of Directors of the National Chamber has stated that if it be the desire of this Convention, the Chamber will be glad to reconstitute its War Service Executive Committee and have it continue to serve in the same capacity in which it has acted during the war, directing attention particularly to the problem of reconstruction affecting all industries.

In this direction the Chamber would wish to make the co-operation of these committees on a national scale as effective as possible, and it will continue to publish such bulletins and reports as may be necessary for their benefit, and place at their service the facilities of its general headquarters in Washington and its branch offices.

It is the opinion of your Committee that this Conference should immediately take advantage of the willingness of the Chamber to undertake this responsibility, and it therefore presents the following resolutions:

*Resolved*, That this conference requests the Chamber of Commerce of the United States to appoint a War Service Executive Committee of such number as may seem best to relate the efforts of all of the War Service Committees, and to aid in making effective the action of this conference and pledges its assistance to the National Chamber in securing the service on the Committee of such leaders of industry as may be called to act.

*Resolved*, That the chairmen of the War Service Committees of the industries shall constitute a Council to be advisory to the War Service Executive Committee, and to meet from time to time at the call of the Executive Committee or any twenty-five members of the Council.

*Resolved*, That new War Service Committees representing industries not now organized may be recognized by the War Service Executive Committee or by the Council.

**27—National Trade Associations**—The experiences of the war have clearly demonstrated the value of national trade organizations and their service to the country as well as to industry.

This conference heartily approves the plan of organizing each industry in the country in a representative national trade association and expresses the belief that every manufacturer, jobber and producer of raw materials should be a member of the national organization in his trade and cordially support it in its work.

## British FE2B Pusher Fighting Biplane

The FE2B biplane is one of the oldest types used by the British army, having been first brought out in December, 1915, and remaining in use up to the end of the war. It is a two-seater machine fitted with 160-hp. Beardmore engine and equipped with two Lewis machine guns. In addition it is designed to carry 300 lb. of bombs. The machine has a total weight of 2827 lb., its ceiling is 11,000 ft. and its endurance at 10,000 ft., including the climb, 3½ hr. At ground level it is capable of developing a speed of 83 m.p.h. and at 10,000 ft. 76 m.p.h. The machine is a product of the Royal Aircraft Factory

# Principles of Tractor Radiator Design

Derivation of Some Simple Equations Showing the Dependence of Radiator Capacity on Temperatures, Rates of Flow and Inherent Characteristics—  
Advantages of Thermo-Syphon Circulation in Tractor Work

By E. Goldberger

*Efficiency Engineer, Packard Motor Car Co.;  
Formerly Assistant Chief Engineer, Holt Mfg. Co.*

**T**HERMO-SYPHON cooling is more advantageous in a tractor than in a truck or automobile. It does away with the water pump and it gives substantially the same effect as thermostatic control in connection with pump circulation.

Counterflow radiator systems give better results than direct flow systems, because whereas in the direct flow system the temperature in a given horizontal plane is nearly constant in all rows of tubes, in the counterflow system the temperature decreases toward the front of the radiator, allowing the hottest water to come in contact with air that has already been warmed up, while the coolest water comes in contact with fresh, cold air. The result is a greater drop in temperature.

The variable which affects the cooling capacity least is the rate of water circulation. The amount of water carried in the tank can be disregarded from the standpoint of cooling capacity, as is evidenced by the fact that adding water tank capacity to an unsuccessful radiator only delays the time when the water begins to boil.

These conclusions are all reached by calculating the heat flow from basic principles. The results in practice bear out the conclusions arrived at by calculation, and by means of the formula given it is possible to accurately calculate the results that will be obtained from any given radiator having a predetermined cooling coefficient. The coefficient of cooling capacity  $K$  will differ with the type of radiator, and some experiments have been made for determining this coefficient, notably by the Holt Mfg. Co., Peoria, Ill. The method of carrying out these experiments and of making the calculations necessary to arrive at a working formula are outlined below.

The symbols used for the variables in these radiator calculations are as follows:

$H$ , B.t.u./min., heat dispersed by radiator per min.

$W$ , lb./min., water circulated per min.

$A$ , cu. ft./min., air circulated per min.

$T_{w_1}$ ,  $T_{w_2}$ , deg. Fahr., average temperature of water on entering and leaving the radiator.

$T_{a_1}$ ,  $T_{a_2}$ , deg. Fahr., average temperature of the air entering and leaving the radiator.

$v$ , ft./min., average velocity of air just in front of radiator.

$K$ , B.t.u./sq. ft./deg. Fahr./min., specific cooling capacity of the radiator or the B.t.u. carried away per sq. ft. of radiator surface in one minute, when the difference in the average temperature between the water and the air is 1 deg. Fahr.

$S$ , sq. ft., total radiator surface in contact with the air.

The formulæ used in this discussion are given below, and are numbered for reference.

$$H_w = W(T_{w_1} - T_{w_2}) \quad (1)$$

$$H_a = 0.017A(T_{a_1} - T_{a_2}) \quad (2)$$

$$H_s = SK \frac{T_{w_1} + T_{w_2}}{2} - \frac{T_{a_1} + T_{a_2}}{2} \quad (3)$$

$$H_w = H_a = H_s = H \quad (4)$$

$$H = \frac{1}{\frac{1}{SK} + \frac{1}{2W} + \frac{1}{0.034A}} \quad (5)$$

The above formulæ are assumed in the discussion which follows and are the basis for all the conclusions reached. Those who wish to follow up their derivations will find them appended to this article.

I shall not discuss the problem as to how large  $H$  should be in order to permit of cooling a certain size and make of gasoline or kerosene engine; all we care to know at present is how many B.t.u. per minute a radiator can transmit to the air. From the form of equation (5) we can draw some very important conclusions, as follows:

The radiator is only one of the elements affecting the results, and not the most important one either; other elements under our control, such as the quantities of water and air circulated per minute are just as vital as the radiator itself.

## Water Tank Capacity

The amount of water carried in the tank can be disregarded from the standpoint of cooling capacity, and is not a factor in the above equations. This conclusion is not new to many engineers. However, a few years ago one of the most successful tractor concerns persisted in building its water tanks larger and larger in a vain effort to overcome excessive heating of its engines.

To be sure, if we start the engine when the water in the tank is cold, it may take 30 min. before it reaches a constant temperature, and if we double the tank capacity it may take one hour before that condition is reached; if we stop the engine every now and then and give the water a chance to cool down, as in an automobile or a truck, we avoid the overheating, but a tractor that has to stop every hour to take on cold water or wait to cool off is a failure.

## Extreme Summer Conditions

We can also see from equation (5) that after a decision has been made as to the type and size of radiator ( $S$ ), quantity of water circulated by the pump ( $W$ ) and quantity of air circulated ( $A$  and  $K$ ), all of which factors are controlled by the designer, the heat carried away will be proportional to the difference between the highest water temperature and the atmospheric temperature (which can easily be measured). Furthermore, if we expect the tractor to work under the extreme summer conditions of our climate, the atmospheric temperature must be taken at 100 deg. Fahr. and the water temperature somewhat

lower than 212 deg. Fahr. Knowing the features of the cooling system, we can easily foretell whether it will work or not under extreme summer conditions of any climate.

There is, nevertheless, the coefficient  $K$ , which has to be determined, and this can only be done by field or laboratory test (once for all) with every type of radiator, varying the velocity of the cooling air.

Such experiments for tractor radiators were undertaken (for the first time as far as the writer knows) by the Holt Mfg. Co., of Peoria, Ill., in 1915.

A water meter was built into the circuit between the radiator and engine, and temperatures were measured at the inlet and outlet of the water, to and from the radiator. These quantities being known,  $H$  can easily be figured from equation (1). However, care must be taken to determine the average temperatures by taking observations after the motor has reached a constant working temperature; the quantity of water circulated per minute will not necessarily be the same when the water meter is removed from the circuit.

#### Engine Measurements

Measurements made with the engine running steadily at full load will be more accurate than measurements at half load or less, since in the former case the temperature range of the water is greater, and any error made in the observations has a lesser influence on the error in the final results.

To solve equation (2) the quantity of air can be arrived at by measuring the air velocity with an anemometer placed a few inches in front of the radiator (in order to avoid obstruction of the air current) and multiplying it by the section of the air passage. It is a good plan to build a hood or shroud in front of the radiator, from 6 to 10 in. deep, of the same section as the radiator air passage, as this insures greater accuracy in the measurement of air flow. It is easy to measure the temperature of the air drawn in, but it is very difficult to obtain a correct average of the air temperatures as measured behind the radiator. These temperatures naturally decrease toward the bottom of the radiator, and they are not constant on a given level, so the best that can be done, if it is desired to avoid the use of special apparatus, is to figure  $T_{a1}$  from equation (2),  $H$  being known from equation (1) and the other variables measured.

By substituting in (3) all variables as measured or calculated, the correct value of coefficient  $K$  is found.

Fig. 2 shows that this coefficient increases directly with the air velocity, with practically all types of radiator, although there are great differences between the values of  $K$  for different types.

#### Example from Practice

Let us now figure out the following example:

A radiator is built with 28 sections of 3 tubes each, 26.35 in. long, of which 23.75 in. is covered with spirally wound fins. The total cooling surface figures out to  $S = 156$  sq. ft. Other factors may be assumed as follows:

$W = 270$  lb./min.

$A = 8500$  cu. ft./min.

$v_1 = 1480$  ft./min.

$v_2 = 100$  ft./min.

$v = v_1 + v_2 = 1600$  ft./min.

$K = 0.255$  B.t.u./sq. ft. deg. Fahr./min.

Water per min.

Air per min.

Air velocity with tractor stationary

Average increase in air velocity due to tractor speed

Corrected air velocity for traveling tractor

Under extreme summer conditions this radiator equipped with water pump and fan will radiate:

$$H = \frac{205 - 100}{\frac{1}{156 \times 0.255} + \frac{1}{2 \times 270} + \frac{1}{0.034 \times 8500}} = \frac{105}{\frac{2.500}{100} + \frac{1.85}{100} + \frac{.346}{100}} = \frac{10,500}{3.031} = 3450 \text{ B.t.u./min.}$$

On the basis of 80 B.t.u./hp./min. to be radiated, this radiator would take care of a  $\frac{3450}{80} = 42$ -hp. tractor engine.

#### Comparative Effect of Variables

In order to see to what extent either one of the fundamental variables ( $S$ ,  $W$ ,  $A$ ) affects the quantity of heat radiated, let us increase the value of either  $S$ ,  $W$ , or  $A$  by 20 per cent.

	$S$	$W$	$A$	$K$	$H$	Per Cent $H$
1....	156	270	8,500	0.255	3,450	100
2....	187	270	8,500	0.220	3,570	103.5
3....	156	325	8,500	0.255	3,500	101.5
4....	156	270	10,200	0.300	4,020	116.5

Illustrating notation

Fig. 2.

Variation of radiator coefficient  $K$  with air velocity

Fig. 3

Direct and counterflow circulation systems

It will be easily seen that the most important element of a cooling system is by no means the radiating surface but the quantity of air drawn in; it is therefore permissible to say that if the quantity of air passed through the radiator is increased considerably, the cooling surface can be decreased until the radiator manufacturer is left very little to do. This, however, would not be economical.

#### Thermostat and Thermo-syphon

The variable which affects the cooling capacity of the above system least is the quantity of water circulated per min. Yet, as soon as the water circulation is stopped or considerably reduced the cooling system will not transmit any heat. Upon this principle is based the thermostat used so extensively in automobiles. Making an exception of thermostatically controlled systems, the water circulation can be reduced considerably, if the air circulation is slightly increased, yet the cooling system will be just as efficient as before. This leads us to the question of the advisability of using the thermo-syphon system of water circulation in tractors.

The circulation of air through the radiators of automobiles and trucks is due chiefly to the comparatively high speed on the road, while the fan is supposed to take care of the reduced need for cooling when the car is stopped and the motor runs idle; in this case, if in addition to the reduced air supply the water supply were small, the system would not be able to cool the engine even at that reduced load, and much less when a truck is running at low speed with a full load. Therefore most of the automobiles have a forced, large water circulation. Conditions are entirely different on a tractor. The fan is supposed to furnish all or nearly all of the air necessary for cooling, and if the thermo-syphon system is built to work satisfactorily at full load, it will work just as satisfactorily when the tractor is not traveling at all. The thermo-syphon system is, therefore, more advantageous in a tractor than in a truck or automobile; it does away with the water pump and gives the same effect as thermostatic control.

#### Specific Cooling Capacity

Special attention must be called to the fact that what distinguishes a good radiator from a poor one is the value of  $K$ , the specific cooling capacity at varying air velocities; this curve is the characteristic of the radiator. Radiators should not be bought per pound or per square foot or per foot, but per unit of cooling capacity.

The radiator above referred to and its specific cooling capacity ( $K$  curve) did not prove entirely satisfactory, and the new size of tractor manufactured by the concern is fitted with a honeycomb radiator.

#### Direct and Counterflow Radiator System

Even with a given type, size and number of tubes, etc., the results can be changed by varying their distribution. Experiments were made with a radiator having its tubes arranged in three rows. The first time, the water passed downward through all of them, while the second time the section headers were cast so that the water passed downward in the tubes nearest the engine, upward in the middle ones and downward again in the front ones. The specific cooling capacity  $K$  was increased and the cooling effect was generally improved, the explanation being as follows:

In the first case the water temperature in the same horizontal plane is nearly constant in all three rows of tubes, while in the second case the temperatures decrease toward the front; i.e., the hottest water comes in contact with the air that has already been warmed up some-

what, but the coolest water in the front rows comes in contact with the fresh cold air. The result is a greater drop in the temperature. This principle has been applied successfully to steam engine condensers for a long time, and because the air flow and water flow have opposite directions it is called the counterflow system.

With tubular types of radiator based on either the direct or counterflow system, the cooling capacity of the front tubes is the highest, and the capacity of succeeding rows decreases step by step.

#### Number of Rows in Tubular Radiators

This is due to the fact that the temperature of the cooling air increases as it penetrates the radiator. Therefore, the average cooling capacity ( $K$ ) of the whole radiator is smaller the greater the number of rows. Whether three or four or five rows are the most economical, depends upon the type of tubes and available frontal area.

The equations given above are based on the laws of physics and have been verified by test. The physical laws involved are as follows:

a. The rise or drop in the temperature of liquids is proportional to the heat absorbed or lost. Thus the temperature of 1 lb. of water increases 1 deg. Fahr. for every 1 B.t.u. absorbed; hence for our case:

$$H_w = W(T_{w_1} - T_{w_2})$$

b. The same law applies for the air, the temperature of 1 cu. ft. of air increasing 1 deg. Fahr. for every 0.017 B.t.u. absorbed, hence:

$$H_a = 0.017A(T_{a_2} - T_{a_1})$$

c. When a fan is used to move the air, as in the case of radiators, all heat is transmitted from the water to the radiator wall, then through the wall and finally is given up by the wall to the air and dispersed by convection. Thus the amount of heat that passes through the wall increases in direct proportion to the cooling surface and to the difference in temperature between the water (inside) and the air (outside).

$$\text{The average air temperature is } \frac{T_{a_1} + T_{a_2}}{2}$$

$$\text{The average water temperature is } \frac{T_{w_1} + T_{w_2}}{2}$$

Hence the average difference is

$$= \frac{T_{w_1} + T_{w_2}}{2} - \frac{T_{a_1} + T_{a_2}}{2}$$

In order to express the heat that passes through the radiator walls in B.t.u. per min., the product of radiator surface and average temperature difference must be multiplied by a coefficient  $K$ , which expresses the amount of heat transmitted to the air in one min. per sq. ft. of cooling surface and for 1 deg. Fahr. difference in temperature. The equation then reads:

$$H_s = SK \left( \frac{T_{w_1} + T_{w_2}}{2} - \frac{T_{a_1} + T_{a_2}}{2} \right)$$

This coefficient varies with the type of radiator, but once the type is determined, it is found to be independent of either temperature of air or water, or the rate of water circulation, the only factor affecting it being the speed of the cooling air, as will be described later.

d. Since the amount of heat lost by the water ( $H_w$ ) is the same as that passing through the radiator walls ( $H_s$ ) and also the same as that finally carried away by the air ( $H_a$ ), we can write:  $H_w = H_s = H_a = H$ .

e. In the following formulas eliminations and substitutions will be made in order to express the quantity of heat in terms of such variables as are under our control. Eliminating  $T_{w_2}$  and  $T_{a_2}$  from (1) and (2) we find:

$$T_{w_2} = T_{w_1} - \frac{H}{W}$$

$$T_{a_2} = T_{a_1} + \frac{H}{0.017A}$$

and substituting these values in (3) we get:

$$H = SK \left( T_{w_1} + \frac{T_{w_1}}{2} - \frac{H}{W} - T_{a_1} + T_{a_1} + \frac{H}{2} - \frac{0.017}{2} \right)$$

$$= SK \left( T_{w_1} - \frac{H}{2W} - T_{a_1} - \frac{H}{0.034A} \right)$$

$$\frac{H}{SK} = T_{w_1} - T_{a_1} - H \left( \frac{1}{2W} + \frac{1}{0.034A} \right)$$

$$H \left( \frac{1}{SK} + \frac{1}{2W} + \frac{1}{0.034A} \right) = T_{w_1} - T_{a_1}$$

$$h = \frac{T_{w_1} - T_{a_1}}{\frac{1}{SK} + \frac{1}{2W} + \frac{1}{0.034A}} \quad (5)$$

This formula can be transformed to apply to 1 hp. developed by the engine by denoting by  $h$ ,  $s$ ,  $w$  and  $a$  the heat radiated, radiator surface, quantity of water and quantity of air per horsepower respectively. The formula will then read

$$h = \frac{T_{w_1} - T_{a_1}}{\frac{1}{sK} + \frac{1}{2w} + \frac{1}{0.034a}}$$

This formula can be easily transformed to give the radiator surface  $s$  as a function of all other variables.

An expression for the radiator frontal area has been derived by A. B. Modine, of the Modine Radiator Co., and was given by him in a paper read at an S. A. E. Minneapolis Section meeting. The expression is derived from equation (2) above, and does not take into consideration the influence of the rate of water circulation and its temperatures. Every one of these variables affects the difference between the air temperatures in a way which cannot be expressed easily, except through the above equations.

## Counting Engine Parts

Editor AUTOMOTIVE INDUSTRIES:

I have read with interest the article on the Hispano-Suiza motor. It seems to me that the introductory paragraph is a slight indulgence in "sharp practice." I quote the following: "It is said that the Mercedes aircraft engine has approximately 900 parts to 400 in the Hispano-Suiza." This sentence does not say that 900 parts is approximately the total pieces composing the Mercedes, or that 400 pieces is the total making up the Hispano-Suiza motor. But how many will read this sentence in terms of total instead of a ratio?

I will assume that reference is made to the Mercedes six-cylinder dual or four-valve motor, and to the Hispano-Suiza eight, as per illustration.

It is possible that I do not know how to count parts of a motor; therefore, I will state my idea on this matter. Motor parts must include, in addition to the special parts, all screws, studs, nuts, lockwashers, cotterpins and gaskets. We will count the connecting-rod staff as one part, for the benefit of the pressed steel rodmaker as an encouragement to him. I think it proper to exclude all accessories, except the radiator fan, for the reason of making a fair comparison between the gear-driven and the belt-driven fan.

Let us now count a few of the parts of the Hispano-Suiza motor: Bolting the cylinders to the crankcase, it appears from the illustration, requires eight studs per cylinder.

For 8 cylinders equal a total of .....	64
Lock washers or cotterpins .....	64
Nuts .....	64
Cylinders .....	8
Valve assembly (5 pieces), 16 assemblies .....	90
Connecting-rod and piston assembly per units in pairs equal .....	156
Total .....	428

You will admit that the above items are only a starter as compared to the total parts actually required to make a complete assembly of the Hispano-Suiza motor.

My interest in this article is due to the fact that I expect to soon announce a twelve-cylinder design, on aircraft lines, that requires about 800 pieces to make a complete assembly, counting as above stated.

C. M. MOHLER.

## Book Review

*The Gasoline Automobile*. Volume 3, Electrical Equipment. By P. M. Heldt. P. M. Heldt, Nyack, N. Y.

The third volume of the *Gasoline Automobile*, dealing with the electrical equipment, follows closely the style of the two previous volumes, which dealt with the engine and chassis construction, development and design. In the present volume, all sorts of ignition, starting, lighting and other electrical equipments are gone into in the most minute details, and not only the action and operation of the device is described, but also a considerable amount of engineering information, formulas, shorts, etc.

Like the other two volumes in the set, the present volume was written mainly to meet the needs of automotive engineers and students of the science and art of automotive engineering. However, the third volume differs somewhat from the two preceding ones both in method of treatment and in the scope of its appeal. There are in the country at present a large number of managers and employees of garages and service stations who have to take care of electrical apparatus, and it has been the author's aim to incorporate in the book such material as is required to make it serve them as a practical hand-book of their trade.

What will probably appeal most to the reader, who is connected with a garage or service station, are the sections on the maintenance, care and repair of the different items of electrical equipment. In dealing with these subjects the aim has been to make the information given of as wide application as possible, and always to explain the underlying reasons for defective operation observed and for remedies applied.

Much of the material in this book was originally prepared and run as a series of articles in *Horseless Age* during 1914 and 1915. The publishing rights have now been secured, and the material has been revised and brought up-to-date.

## Paper Driving Belts

PAPER substitute driving belts are now being introduced into German workshops, and some particulars of them are given in the *Bulletin des Usines de Guerre* for July 1. The paper is cut into narrow bands, which are then spun. The belts are made by weaving or braiding. Woven-paper belts are of two kinds—paper fabric belts and paper thread belts, the former type being the most frequently used. The fabric is first cut into bands 40 m. long, which are subsequently made up according to the desired width and thickness. A core of strengthening material is interposed, either cotton or sheet metal, though more recently these cores have consisted of paper thread and metal wires interwoven. The core is surrounded with the paper strips and the whole sewn with strong thread. Belts so prepared are said to be very flexible and to wear satisfactorily. Woven paper belts have a tensile strength of from 100 to 125 kilos. per centimeter of width.

## Houdaille Brings Out Adjustable Car Suspension

Inventor of Shock Absorber Fame Turns His Attention to the Spring Suspension Problem—By Moving the Points of Attachment of the Springs to the Car Frame, Car Suspension Can Be Rendered Independent of the Load

By F. W. Bradley

ONE of the greatest obstacles to obtaining perfect car suspension is that road springs have of necessity to be calculated for a fixed load, while in practice they work under constantly varying conditions. The best suspended car is a racing machine, for here the distribution of weight is calculated to a nicety and modified by practical tests on the road and, with the exception of the gasoline in the tank, the load on the springs is constant. At the other end of the line is the 5-ton truck, the springs of which may be carrying a load of 18,000 pounds at one moment and at the next not more than half this amount. This explains why, even with the addition of springs and pneumatic tires, it is difficult to make a truck or a motor omnibus as comfortable as a touring car.

But even in the touring car class conditions are not ideal, and the lighter the car, or the lower the ratio of dead load to useful load, the more difficult is the task of the spring maker and designer. Every driver is aware that in practically all cases a car with its full complement of passengers rides more comfortably than when only the driver is aboard. So important is this that under certain road conditions the maximum average speed is determined more by the suspension than by the engine. Examples of this can readily be found on war-worn French roads. One particular instance may be cited. On a certain stretch of hard macadam road which had been badly worn by heavy army traffic and scarred by an occasional shell, the fastest cars were not those with the highest maximum speed, but those with the best suspension. In other words, certain cars with small engines but excellent general suspension made better time over this bad stretch than other cars with bigger engines but poor springs.

Usually, in touring car practice, the bigger the car the better the suspension. This arises from the fact that the variation in spring loading is much less in the case of the big car than for the small

vehicle. A very light five-passenger touring car, having a load on the springs of 1700 lb. (this comprises frame members, engine, transmission, body and accessories) will carry a useful load of 750 lb. (five passengers at 150 lb. each). The maximum useful load put on the springs is about 44 per cent of the fixed load, and the minimum useful load is about 9 per cent of the same.

### How Load on Springs Varies

In the case of the big, powerful car, carrying a heavy limousine body, the fixed weight on the springs may run as high as 4000 lb., while the useful load, as represented by five passengers, will still be 750 lb. This represents 18.7 per cent of the invariable load. With only the driver in the car the useful load of 150 lb. represents 3.7 per cent of the fixed load. This difference, in the case of the big car, is of such small proportions that if easy riding is obtained with the maximum useful load aboard, the riding will not be appreciably hard when only one man is carried. In the case of the light car, however, it is practically impossible to assure easy riding with the

Ten-horsepower Renault car fitted with Houdaille adjustable suspension (adjusted for full load)

*Showing numerals on spring horn by which adjustment for different numbers of passengers can be made*

maximum load and the same degree of comfort when 35 per cent of the load has been removed.

With a view to securing the same degree of comfort, whether the load be the minimum of one passenger, or the maximum of five or six, M. Maurice Houdaille has produced a device which was patented in all countries before the war, and has been brought to the production stage during the past few months. Mr. Houdaille is a French inventor well known beyond the limits of his own country by reason of his shock-absorbing devices.

### Stiffness of Spring Varied

By this device Mr. Houdaille increases the stiffness of the spring as the load is increased; inversely, he renders the spring more flexible as the useful load is decreased. The adjustment is so made that the vertical distance between the spring center and any fixed point on the chassis frame is invariable, whatever the load.

This result is obtained in a very simple manner. Instead of a fixed eye at each extremity of the master leaf of the spring, there is an elongated groove within which the spring bolt can be moved by means of a suitable mechanism (lever or wheel) placed conveniently to the driver's hand. A glance at the illustrations will make the construction clear. With the minimum load the two eye bolts of each rear spring are at the outer extremities.

As passengers are added, the two bolts are brought closer together, that is to say, nearer the axle, thus stiffening the spring. Thus, instead of the spring "flattening" as passengers get into the car, it retains the invariable curvature at which it can best do the work required of it. The invention does not change the appearance of the car to any appreciable degree. The links by means of which the spring eye bolts are moved in their grooves is carried inside the frame members and connected up to a lever placed near the driver's right hand. It is obvious, however, that there are several mechanical means of obtaining this movement, and that a wheel might be used instead of a lever.

This device is not an accessory to be added to the car in the same way as a shock absorber or a spring buffer. It is necessary for it to be incorporated in the design, in order to get the best results. Also, it does not allow of the drive being taken through the springs.

### Device Tried Out on Renault

All the experimental and demonstration work in connection with this invention have been carried out on a Renault 10 hp. light touring car. The front springs remain unchanged; the rear springs have had the fixed eye changed for elongated grooves and the main bolts are movable in these grooves by means of suitable links and a side lever. Five positions are obtained, corresponding to 1, 2, 3, 4, 5 passengers. As a practical demonstration, I took this car on some of the granite paved roads in the suburbs of Paris, these being roads paved with rough granite blocks laid on a poor foundation and constituting, undoubtedly, the most destructive road surface to be found in Europe.

With only two persons aboard the lever was set so as to give the springs their maximum degree of stiffness; in other words, the springs were in the condition designed by Renault and were suitable for carrying 5 passengers. With this setting the car rode "hard" on the better stretches of road, while on the rough stretches it danced about in a manner painful for the riders and destructive to the whole mechanism. Pulling over the lever so as to correspond to the two passenger position, the same stretch of road was covered at the same average speed. The difference was so pronounced as to leave absolutely no doubt as to the efficiency of the device.

### Armstrong-Whitworth Quadruplane

*This is a two-seater general utility machine of an unusual type fitted with a 130-hp. Clerget engine. It was brought out by Armstrong-Whitworth, Ltd., in October, 1916, but was never adopted by the military authorities. Its performance was poor, the ceiling being 11,000 ft. and the speed at ground level 84 m.p.h.*

# Real Labor Representation

Plan of the Midvale Steel & Ordnance Co. Analyzed and the Reasons  
for Its Success Pointed Out—Based Upon  
Political Organization

By Harry Tipper

**I**N CONSIDERING the type of organization which should be created within the industrial unit to exercise those judicial and legislative functions which cannot be taken care of adequately by the executive organization, it is evident that the character of the industry and the different occupational requirements of its work will have considerable bearing upon the actual plan.

The contracting field, with its movement from job to job, and the difficulties attending the maintenance of the stable organization, presents an entirely different problem from the iron and steel industry, or the machine shop.

Where the labor problem is concerned with large industrial units governing to a considerable extent the local social conditions, the breadth and simplicity of the requirements will enable the manufacturer to establish an organization made up along somewhat similar lines to the political organization of this country.

Where the occupational requirements are sharply divided within the organization, and there is considerable social difference corresponding to these definitions, the organization which shall treat all employees with proper regard to the requirements of the case must take on a more complex character.

Where the character of the industry is such that there are no local units around which all or most of its productive activities center, the requirements of the matter

will favor a different type of organization from either of the preceding.

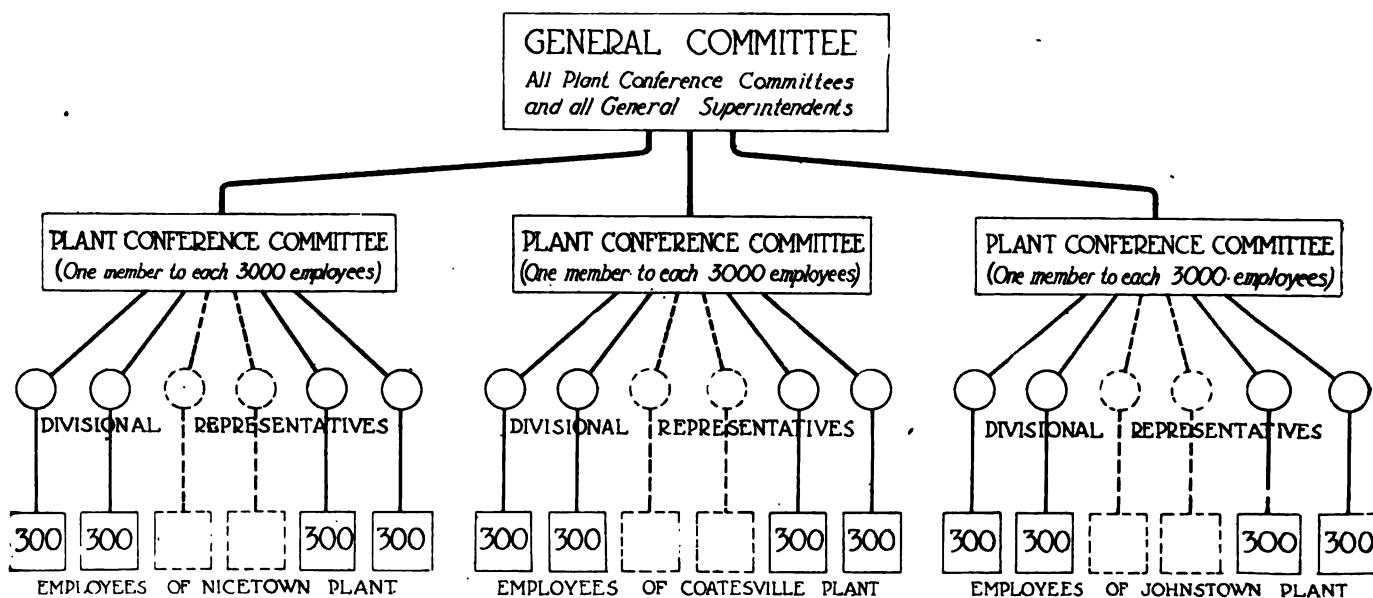

In the railroad field, for example, where one industrial organization deals with many localities, and where the very character of the business removes it to some extent from local considerations, methods which can be employed by factory units would not meet all the requirements of the case.

It is logical that in this field occupational labor organizations of a national character should secure great power, as the very character of the business ties the local bodies together in common desires and necessities to a much greater degree than in other industrial operations.

## Conditions Govern Organization

In considering specific plans which have been worked out by a particular manufacturing organization, it is necessary to pay some attention to the conditions in the industry with which the organization in question is concerned. What may be of value in the iron and steel industry would probably require modifications in order to be put into practice in the textile field.

The governing principles, of course, are the same no matter what varying forms individual practice may have suggested, but a proper distinction must be made between the principles involved and the modifications in the application of the principle which have arisen out

### GENERAL PLAN OF THE MIDVALE STEEL & ORDNANCE CO.

For general legislative purposes, joint quarterly meetings of all elected representatives and officials of the company are held. Judicial procedure in the adjustment of special grievances is from the employer to Division Representative, from Division Representative to Plant Conference Committee, to Joint Committee of Plant Conference and General Superintendent and from this committee to the General Committee

of the traditions of the organization and the special requirements of the industry.

For this reason a discussion of any plan which has been instituted as the result of experiments in any individual industrial organization will be accompanied with some comment from the conditions in that particular field, and the effect which such conditions may have had upon the application.

It is usual, however, for the differences in application to emphasize themselves in the consideration of changes or departures from custom, and it will be found that the similarities will greatly outweigh the differences in all cases. It should be thoroughly understood, therefore, that the details of the plan presented for consideration, which may not be applicable in any one's case, should not be allowed to militate against the value of the general experiment, or to obscure the fundamental character of the changes.

### Organization Must Start Small

It is perhaps wise at this time to point out that organization as a growth must have its beginnings in the small thing. The machinery of a new organization should be founded so solidly upon known principles of organization that it will be capable of adapting itself to the larger requirements. But it is wise that the work specifically called to its attention should be of such a character in the beginning that it will have an opportunity to stabilize itself, strengthen itself, and carry its roots firmly into the business, before requiring it to attempt the solution of the largest and most difficult problem.

Some little time ago in the first part of this series of articles reference was made to the announcement of the Midvale Steel & Ordnance Co. in regard to its plans for the establishment of a co-operative organization within its own industrial unit. Since that announcement was made the first meetings have been held, the machinery of the organization has been established, and a part of its work begun. While the machinery of this organization differs in some important particulars from experiments established at an earlier time, it will be seen that it provides the opportunity for the settlement of the matter specifically mentioned, not only but also for the disposition of many other matters as the organization welds itself together and develops its functions through the process of its own operations.

### Better Operating Discipline

It is also necessary to point out that such machinery properly organized and operated so as to gain the confidence of the workers results in a better operating discipline. The fear which is frequently expressed by the employer that the establishment of legislative machinery and the allowance to the worker of a share in the responsibility for the decision affecting his working conditions, will result in a breakdown of discipline, has no basis in fact at all.

Instead of breaking down the operating discipline which is so necessary for the proper continuance of the production, the experience of individual organization contains plenty of evidence that the discipline has been increased by the incentive of responsibility and the consent which comes from a larger measure of understanding.

In the plan of the Midvale Steel & Ordnance Co., which is shown graphically in connection with this article, the only stated purpose is to provide a judicial means for taking care of the individual grievance and the individual complaint. There is nothing in the announced constitution of this machinery which specifically concerns itself

with the settlement of the wage question, the hours, and other general economic conditions about which the labor union has so far concerned itself almost entirely.

It should be noted, however, that the organization as it has been established does provide machinery thoroughly applicable to these larger necessities. The fact that these matters are not mentioned in the plan should not therefore be allowed to limit its usefulness in the eyes of those who are primarily interested in the provision of organization machinery to dispose of these important questions.

It is evident that the Midvale Steel & Ordnance Co. has had in mind the necessity for limiting the purposes of the organization in its early stages so that it shall have an opportunity to get together and operate upon questions which are comparatively small; that is, upon questions which do not affect the general body of the workers, and upon which the habit of free discussion and proper agreement can be developed without some big question wrecking the newly formed organization machinery.

### May Be Grave Mistake

It would be a grave mistake if such an organization were formed during the heat of controversy upon a general grievance and expected to deal properly with that grievance. The matter would touch the newly elected representatives too nearly. It would be affected too seriously by the strangeness of the individual in his new surroundings, and it would be too crucial a test. It is much better that the organization should be formed for stated purposes which are just as important, but which do not immediately affect the general welfare of the whole body of workers, nor the general financial development of the whole industrial unit.

The plan adopted as a result of the announcement made by the Midvale company to its workers was the final agreement of a conference between a committee of workers chosen from among the elected representatives of the employees, and the vice-presidents and general superintendents of the three plants of the company. The record of this meeting is sufficiently interesting to be included in this article.

The proceedings at these meetings were as set forth in the following extract from the minutes:

The meeting was called to order by Mr. Wm. B. Dickson, vice-president of the Midvale Steel & Ordnance Co., who addressed those present congratulating them on having been honored by their fellow-workmen by being elected as their representatives; and welcoming them to the Council table of the company.

Mr. Dickson then called for nominations for chairman of the meeting. John E. Koontz and F. X. Faas were nominated. On a show of hands Mr. Koontz was declared elected. On motion of Mr. Faas, properly seconded, the nomination of Mr. Koontz was declared unanimous.

Mr. Koontz called for nominations for secretary. Mr. Faas was nominated and elected for the position as secretary of the meeting.

For the purpose of facilitating the work of the conference, Mr. Dickson presented for the consideration of the employees' representatives, a tentative draft of a proposed plan for the purpose of establishing a representative system, which will provide a regular means of communication and conference between the officials and the employees of these companies. (In presenting this tentative draft, Mr. Dickson made it plain to the representatives that this was done not with any purpose of unduly influencing their action, but only to give some basis on which to proceed with the work in hand. As a matter of fact, the draft was amended in several important respects before final adoption.)

This draft was submitted, item by item, to the votes of the

# Apparatus for Checking Screw Threads

## Machines Used in Inspecting Plug and Ring Thread Gages and Similar Threaded Parts Requiring Great Accuracy—Methods of Operation

**O**WING to the exigencies of war, much work has been done in recent years in the development of devices for inspecting and checking the accuracy of screw threads. The need for close inspection arose from the fact that threaded parts made in one factory had to fit parts made in another factory, and unless the threads were held within very close limits, this requirement could not be met. In the shop it is customary to use "go" and "no go" plug gages and ring gages and these gages necessarily must be subjected to a very rigid inspection.

The first instrument used for checking threaded parts as to diameter was the thread micrometer. However, as the Government departments used a more refined system of measurement, many thread gages which had been inspected by means of the thread micrometer and passed at the factory were rejected. The next step in measuring pitch diameters was the use of the wire system, two or three wires of standard sizes being placed in the thread on opposite sides of the screw, and a micrometer measurement taken over them. However, the way this system was applied in the beginning, by fastening the wires in place by means of rubber bands strung over their ends, which bent or bowed them, not sufficiently accurate results were obtained.

Gradually machines have been worked out by means of which the various systems of measurement evolved can be applied so as to insure the most accurate and rapid results. The angle of the thread is now generally measured and its contour studied by means of a projection machine. This consists essentially of a fixture for holding the thread profile in front of a stereopticon lamp, so that a greatly magnified shadow of it is thrown upon a screen, where it can be carefully studied and the angle accurately measured.

### Two Types of Projection Machines

There are two general types of machines of this kind on the market. One of them is a machine of great length, in which the projecting apparatus is mounted at one end, and the screen upon which the shadow is cast, at the other, some 25 ft. away. In the other type of machine the image of the screw profile is thrown upward against a reflector suspended from the ceiling, this reflector throwing the image down onto a screen located close to the operator. The advantage of this type of machine is that one man can at the same time adjust a specimen, focus the light, and read off the result on the screen close to him. It is also obvious that much less floor space is required with a machine of this type.

A projection apparatus of a type designed by the Bureau of Standards, Washington, D. C., is manufactured by the Arthur Knapp Engineering Corporation, New York. An illustration of this device is shown herewith. The general principle of the device is as follows:

The threaded part (gage) to be examined is placed in a beam

of parallel light, and by means of a suitable lens system, the shadow cast by the part is projected on to a screen. The field of parallel light rays is obtained from an inclosed arc lamp in a lamp housing *L*. The light from this lamp passes through the condensing lens *A* in the direction of the projecting lenses *B* and *C*. The screw to be examined is placed at the focus of the compound lens *B-C*, and the light is directed upwards by means of prism *G* to the mirror which is supported about 10 ft. above the prism. The mirror throws the beam of light down onto the top of stage *N*, which forms the screen and carries the standard angle *M* used in the examination of the thread form. In order that the shadow cast by the screw will be a true cross-section of the thread form, it is necessary that the parallel beam of light pass through the thread at the helix angle. To make it possible to give the beam of light the proper direction, the lamp housing carrying the condensing lens *A* is pivoted about a point beneath the lens *B*. This insures that the beam of parallel light from lens *A* will always be directed at and fill the lens *B*.

### Method of Adjusting Test Gage

Three different adjustments are provided on the stand *E*, one for raising and lowering the screw or thread gage, to be inspected, another for focusing the thread, and a third for moving the thread in the direction of its axis, so as to permit various portions of it to be brought into the center of the screen. The gage to be examined is supported on spring centers on the stand *E*. For convenience in making observations, the gage is raised until the center of the beam of light passes the under side of the thread. Lamp *L* is then turned about the axis of its support until the parallel rays of light from lens *A* pass through the helix angle, which is the case

Set-up of projection machine. Notice the shadow of the thread on the table under the protractor

*Bevel protractor used with projection machine*

when the fringe pattern, formed about the image of the screw owing to imperfect focus, is symmetrical. The gage is then brought into focus by a slow motion device, and the required adjustments are complete.

#### Bevel Protractor

In the examination of the thread angle, use is made of a bevel protractor, also designed by the Bureau of Standards. The standard 60 deg. angle *M* is supported by three columns *S* on the stand *T*, on which rests a protractor ring *P*, carrying the standard angle *M* and the straight edge *E*. In making an inspection of the angle, the standard angle *M* is so adjusted that its shadow coincides with the light space of the projected image, on the surface of the table below. The standard angle *M* is revolved until one of its sides coincides with the shadow of the thread, and the reading of the graduated head is taken through a magnifying glass *R*. By means of a slow motion device on the stand *E*, the gage is then shifted parallel to its axis until the image of the other side of the thread approximately coincides with the other side of the standard angle. By means of a slow movement of the graduated ring, the standard angle is then revolved until it lines up with the other side of the thread, after which a reading of the graduated circle is again taken. The difference between the two readings shows directly the error of the included angle of thread.

By means of the protractor arrangement it is also possible to determine whether the thread is symmetrical about a line perpendicular to its axis. To this end the standard angle is revolved until either side is parallel with the crest of the threads, or else the straight edge *E*, which is perpendicular to a bisector of the standard angle, is placed parallel with the crests of the thread.

#### Accurate Results Claimed

It is claimed that by means of this shadow protractor very much better results can be obtained than by means of a protractor placed directly on the shadow. The reason for this is that by this method two objects of similar character, viz., two shadows, are presented to the eye. In adjusting the gage for a reading, the shadows of the thread and gage are made to approach, and the protractor is angularly adjusted until only a faint, even thread of light remains between the two. Under these conditions, an inaccuracy of a few minutes is easily detected. As regards the quickness with which observations can be taken, it is stated that it requires from one to 10 min. to measure the angles of the thread, depending upon the finish and straightness of the size of the threads being examined. Where the threads are particularly defective, their projection may be recorded on photographic developing paper in order to obtain a permanent record. For this the required time of exposure must be determined experimentally.

Another use to which this projecting lantern may be put is that of measuring profiles and determining the radii of circular arcs. In doing this kind of work, the image of the

profile is thrown on a sheet printed with concentric circles, with radii varying by tenths of an inch. The shadow can quickly be matched with the proper circle, and the radius can then be determined by dividing the reading taken by the scale of magnification. The method is especially applicable to the determination of small profiles having angles which cannot be read by any other means. Irregular shaped profiles may be checked up by means of the micrometers on the gage holder, the result being plotted on a large scale with the co-ordinating dimensions of the two micrometers. The object is moved so that its projected outline passes over a point on the screen, and micrometer readings are taken for any required number of positions.

#### Determining Scale of Magnification

The scale of magnification may easily be determined by throwing the image of an object of known dimensions on the screen and measuring the same. Thread measuring wires will serve this purpose very well. For instance, if a wire of 0.1 in. diameter casts a shadow of 5 in. diameter on the screen, the magnification is 50. Therefore, the dimensions of any other object projected on the screen can be determined by dividing the size of the image by 50.

In order to obtain the most accurate results, everything must be properly adjusted. The reflecting mirror should be directly above the image which it throws on the screen, and this point can be verified by means of a plumb line. By means of the adjustable prism mounting, the light beam can be moved over a wide area, and no difficulty is found in throwing it directly on the mirror above. In order to obtain a parallel beam of light from the condensing lens *A*, the latter must be properly adjusted with respect to the arc lamp. To test this, a cloud of smoke from a pipe or cigar is blown into the beam emerging from the condensing lens. If this beam is of even size, as far as can be determined by the eye, the rays are sufficiently parallel for the purpose of a measurement. When the lamp is improperly adjusted, the smoke reveals diverging or converging rays. The proper condition is arrived at by moving the condensing lens closer to or farther away from the arc lamp.

It is also necessary that the table or screen be perpendicular to the central line of the projection system. This can be determined by removing the projection lenses *B* and *C* and allowing the light from the latter through the condensing lens to pass straight through. An ordinary mirror should be placed on the table or screen to reflect the light thrown on the screen. When this light is thrown back into the latter, the table is perpendicular to the rays. To test this, a card is held at the condensing lens so as to cut off one half of the beams from it. When the back of the card is lighted by the returning beams, the correct adjustment has been obtained.

The Arthur Knapp Engineering Corporation also manufactures an optical lead testing apparatus based on designs

*Machine for optically determining the lead of*

*Machine for determining pitch diameters*

furnished to the Bureau of Standards by the National Physical Laboratory of England. Measurements are magnified about 20 times by a double armed lever, one arm of which is in the form of a stylus which, as the screw is moved in the direction of its axis by a micrometer device, follows the thread outline; they are further multiplied about  $17\frac{1}{2}$  times by an optical device. At the farther end of the lever is carried a lens located underneath an incandescent bulb. A fine line is ruled in silver on the bottom of this bulb, and the lens throws an image of this line onto a ground glass screen in front of the instrument.

#### Testing Pitch of Gage

In testing the pitch of the gage, the stylus *A* is brought to the bottom of the thread, the image of the line on the ground glass is brought to a fixed mark and the reading of the micrometer *S* is taken. Then the micrometer is rotated, the stylus moving to the next thread, the image is brought again to the mark, and another reading of the micrometer *S* is taken. The difference in the micrometer readings is the pitch. The machine will take a plug up to  $3\frac{1}{2}$  in. diameter and about 8 in. long.

When it is desired to measure the lead of a ring gage an equal-armed auxiliary lever is used. This is swung around so that the stylus rests in a V at one end of the lever, and an additional stylus at the other end enters the ring clamped on a face plate and is moved from thread to thread, the same as in measuring a plug gage.

Another machine manufactured by the same concern is used for measuring pitch diameter with the aid of measuring wires. The screw gage to be measured is held between centers, which in turn are held in clamps at the heads of pedestals on a base casting. A micrometer screw 9 is carried on a carriage 10 which on the opposite side carries an anvil. The carriage is supported on three balls in such a manner that it can move very freely.

Measuring wires are conveniently hung from a bracket 15. The anvil of the micrometer is set for zero by means of standard gage blocks or by making readings on a standardized screw. This machine will take plugs up to 3 in. diameter and 8 in. long.

#### Core Check Composition

In checking thread ring gages use is made of cast cores made from a composition having a known heat expansion coefficient. For examining the thread form of the ring gage, a cast is made of a segment of the gage. A special core composition is furnished for this purpose by the Arthur Knapp Engineering Co. This composition is melted in any convenient manner and by means of a ladle is then poured into the lower side of the ring gage, which for the purpose is held in a vertical position in a vise the jaws of which have been faced off so the composition cannot escape. Before pouring, the threads of the gage must be carefully cleaned with benzol in order that the cast may accurately represent the form of the thread.

## Real Labor Representation

(Continued from page 1007)

employees' representatives and, as finally amended by them, on motion duly made and seconded, was adopted in the form as shown on copy attached hereto, marked "A," and, for the purpose of identification, initialed "A," and, for the purpose of identification, initialed on each sheet by the chairman and secretary of the meeting.

On motion duly made and seconded, the meeting adjourned, to meet again, if necessary, on the call of the chairman.

#### Each Clause of By-laws Discussed

The draft of the plan for the establishment of the representative system which was adopted by this meeting was referred back to a meeting of the employees' representatives in each of the three plants. At these meetings the discussion of the by-laws was made upon each clause so that the matter was thoroughly canvassed by the representatives in each of the works and finally approved.

It is too early yet to talk about the results which have accrued from the adoption of this system by the Midvale Steel & Ordnance Company, but it is possible to discuss the plans which were adopted as to their prospective strength and weakness in the light of other developments in organization methods.

The representation of the company upon the joint committees in the different plants is confined to the general superintendent of that plant. In general industrial work such a method would be likely to result in a weakening of the organization because of the limitation of the discussion to the man who while he is responsible for the general operating policy of the plant, cannot be acquainted with all the details which might be necessary to such a discussion.

Neither is it apparent that the general superintendent has the liberty of appointing a representative to be present at a joint conference where some unforeseen circumstances prevent his own attendance. In the average factory in the automotive field it would be desirable that department managers in the plant should grow up as a part of the legislative machinery, adding their value to its discussions and gathering increased effectiveness from the understanding which comes with such discussion.

#### Should Have Regular Meetings

There is nothing stated in the organization plan as presented providing for regular meetings of the representatives or the joint conference committees in the various plants.

This must be regarded as a grave mistake because the value of the whole machinery will depend upon the establishment of confidence and mutual esteem in the minds of the men who comprise the machinery, so that as the organization is called upon to discuss the larger questions at issue, the basis of understanding so established will permit it to come to a full measure of agreement.

This is partly taken care of by the provision for quarterly general meetings, although these general meetings do not entirely fulfill the purpose. It is interesting to note that there is contained in the plan for the election of representatives a provision for the recall of a representative by the employees of any division, where two-thirds of the employees sign a petition that the representative has ceased to be satisfactory to them. It is also important to note that one of the requirements for the election as representative is that the nominee shall have been in the employment of the company for at least one year in the aggregate.

# Cultivating Japanese Automotive Field

## PART IV

### Government Is Most Successful Truck Builder—Industrial Companies Are Experimenting—Mechanical Difficulties Encountered—Shipping Charges and Customs Regulations

By Tom O. Jones\*

**T**HE most successful motor-car building in Japan to date has been the work of the Government at the Osaka arsenal in its production of twenty army trucks. In an effort to further the industry the Government has turned over its drawings to a large firm in Osaka, the Neohon Heiki Seizo Kabushiki Kaisha, a firm formed solely on the strength of an order for munitions from Russia, which has now been filled. The Government has asked this company to build one or two sample trucks, guaranteeing an order for a considerable number if they are satisfactory. The equipment of the plant, while very complete in the way of machine tools for finishing parts, is by no ways adequate for motor production. Foundry and forge facilities are not such as are needed for automobile units, while none of the special equipment for finishing special parts has as yet been installed.

The greatest argument for motor-car building in Japan is that the cost of labor is so much less in the Empire than in America that production could be carried on at much less expense, and that costs would be reduced by the saving in freight. The question of labor was referred to Dr. Ito, who has charge of the work being done by the Mitsubishi Dock & Engineering Co. at Kobe. In his opinion the low cost of labor will not offset the efficiency of the skilled American workman. Even with the highest type of automatic machinery he doubts whether equal results could be obtained.

#### Experimental Work by Industrial Companies

The Mitsubishi Dock & Engineering Co. is one of the largest industrial firms in Japan, and should it engage in motor-car manufacture would have a big advantage. It is going forward very slowly on its work. The company has bought a Buick and a Fiat car for experimental and pattern purposes. If steel is available, an effort will be made to bring out the first experimental car during 1918. Dr. Ito has studied many of the larger English and German motor-car plants, and if the company does enter the field its policy will probably be modeled after

that of the Europeans. Several points have a bearing on the indefiniteness of the company's position. An important consideration is whether there will be a large enough market to warrant the outlay necessary. There are hopes that trade can be developed in China through branches and business connections in that country. At the present time the company is more interested in the development of airplane and marine engines. New buildings have been constructed and some special machinery required in engine building ordered or installed. Probably the outcome of this motor work will influence the decision for or against the building of automobiles.

The Tokyo Gas & Electric Industrial Co. has placed orders for a considerable amount of machine equipment for motor-car production, with a view to entering the manufacturing field on a large scale. Within the last six months this company has taken the Japanese representation for several American cars, or at least has had a considerable number of sample cars sent out. Though very serious in its plans to manufacture motor cars, probably more serious than any other organization in

Japan, Goto Matsukata, the president, declares that the newly established motor department will continue to import American cars without regard to its manufacturing plans, realizing that it is impossible to build more than one type of chassis. The engineer of this firm, I. Hoshiko, is a graduate of Japanese technical schools and has spent several months in America, much of the time as a workman in an American motor-car factory.

The Kawasaki Dockyard Co., of Kobe, has also been considering the building of cars. According to one rumor, the firm was offered a contract for a considerable number of trucks by the Japanese Government, but no definite information as to the position of the company in regard to the matter could be obtained.

#### Difficulties in Engine Construction

The men interested in these companies realize some of the difficulties that face them in starting motor production, but it is doubtful if they realize them fully. One of the big troubles will be engine production, for engines built in Japan to date are not up to the standard required by the hard usage entailed by a motor-car installation. Magnetos, starters, and carbureters will without doubt have to be imported for some time, although

**L**OW cost of labor in Japan will not offset the efficiency of the skilled American workman.

One of the principal reasons why car-building may not meet with success in Japan is the anticipated difficulty in engine construction.

Japanese companies would like to secure building rights on American cars and have many parts sent ready for assembling.

Japanese body builders are experts in the production of handmade enclosed bodies. Tools are primitive and wood is used exclusively.

\*EDITOR'S NOTE—Mr. Jones was formerly with the J. B. Crockett Co., New York, and was given a special appointment by the Bureau of Foreign and Domestic Commerce to investigate automotive conditions in Japan, China, the Philippines and Hawaii. This story is taken from the advance proof sheets of Mr. Jones' report to his departments. Part V will deal with tires, accessories, etc.

efforts to make them are now in progress. Almost without exception, the Japanese companies who plan to build would prefer to secure building rights on American cars, using the drawings of the American manufacturer from whom they secure rights, and have most parts sent from America ready for assembly. The simple castings and forgings would be made in Japan and the assembly completed and the bodies built there.

There is one point that should be considered by an American manufacturer who is approached with such a proposition. These companies are ambitious and will doubtless seek full export rights for the Far East, going even as far as India. If the parts were entered and assembled in bond under the supervision of the Japanese customs authorities, the American cars could be landed at any of the Far Eastern ports more cheaply because of the reduced freight cost on knocked-down shipments, the difference in labor costs, and the lower customs duty on parts. If the car is to bear the name of the American manufacturer he assumes responsibility for the assembly workmanship. If any American manufacturer has such a problem for consideration it would be well for him to consider, in connection with Japan, a China port such as Shanghai, a city with great American influence and in which there are many automobiles and a great number of trained mechanics.

Body building is practically the only branch of motor-vehicle construction that has been developed to any considerable extent in Japan, and it is shipping expense more than anything else that has brought about development along this line. Closed cars are by far the more popular type, and with shipping rates mounting as they have been in recent years the cost of importing complete vehicles from America would have been almost prohibitive, because of the impossibility of packing in a compact space.

#### Nearly All Bodies of Limousine Type

The bodies that are built in Japan show little or no variation. Practically all are of the limousine type. Wood is used exclusively in the construction and every one could be advertised as hand-made, the tools used being primitive indeed from the American standpoint, consisting of adz, saws, planes, and scrapers of various kinds. The wood most generally used is known as "katsura," fairly hard and capable of being worked to a very smooth finish. The cowl is cut from a large block of timber, roughly shaped at first with an adz-like tool, and later planed, scraped, and rubbed to the required form and finish.

The interior finish shows careful attention to detail. Upholstery is usually of light-colored Bedford cord, with braid trimmings and silk window and door curtains to match, although in the case of limousine bodies on low-priced cars leather is sometimes used.

The bodies are built wide enough so that three persons may sit on the rear seat, with two auxiliary seats facing back. Small armrests are provided for the auxiliary seats. Door fittings are of Japanese manufacture with nickel finish. Ash receiver and electric cigar lighters are fittings generally applied. The weight of such a body for a car of 116-in. wheelbase will be approximately 600 pounds.

The workers in the factories receive approximately 50 cents United States currency per day, but there doubtless will be a demand for higher wages in the near future, if an advance has not already been made, as increased cost of living has brought about labor troubles in Japan within the last year. The price of such a body fitted to a car of the size above mentioned is \$700.

The finish is of Japanese lacquer, which gives a glass-

hard finish of good luster. This finish stands well in ordinary use, that is, in its resistance to scratching, but if given a blow hard enough to crack or chip the lacquer, the repairing is an operation that entails considerable labor, more than the repair of a scraped finish on a metal body.

Do these bodies stand up? You can hear various opinions on this point. They certainly look well enough when turned out and some over a year old are in good condition. One American dealer said that he would not allow such a body to be fitted to the high-priced American car he handles. The main fault is that the wood is not properly seasoned.

#### Shipping Routes and Costs

Practically all motor-car shipments to Japan go via Pacific coast ports, either Vancouver or San Francisco. The following tables give a comparison of freight costs for shipments via Panama and direct from San Francisco. The car selected for this purpose is one selling for approximately \$1,000 and weighing in the neighborhood of 3000 pounds, with a case measuring 320 cubic feet. The point of origin selected is in the Middle West, near the center of the industry. These figures are based on rates quoted about March 1, 1918, and are submitted only for the purpose of comparing transportation costs on eastward and westward shipments in carload and less-than-carload lots.

Transportation of 1 car from factory to Yokohama via San Francisco:	
Inland freight to San Francisco.....	\$133.53
California toll tax.....	.40
Ocean freight.....	144.00
Consular fees.....	3.00
Insurance.....	12.20
<b>\$294.13</b>	
Transportation of 1 car from factory to Yokohama via Panama Canal:	
Inland freight to New York.....	\$45.98
Cartage to steamer.....	12.00
Consular charges.....	4.00
Forwarding charges.....	3.00
Ocean freight.....	260.00
Insurance.....	7.80
<b>\$332.80</b>	
Transportation of 4 cars from factory to Yokohama via San Francisco:	
Inland freight to San Francisco.....	\$334.35
California toll tax.....	1.60
Ocean freight.....	576.00
Consular fees.....	3.00
Insurance.....	49.50
<b>\$973.45</b>	
Transportation of 4 cars from factory to Yokohama via Panama Canal:	
Inland freight to New York.....	\$137.34
Cartage to steamer.....	48.00
Consular fees.....	4.00
Forwarding charges.....	3.00
Ocean freight.....	1,040.00
Insurance.....	30.00
<b>\$1,262.34</b>	

There is no great obstacle in the customs requirements confronting either the Japanese dealer or the American manufacturer, but care should be taken in the preparation of invoices. At the present time France has a commercial treaty with Japan which gives French manufacturers special concessions in what are known as the conventional duties. These same privileges are extended to the American manufacturers under the most-favored-nation clause, but to secure them the manufacturer must attach a certificate of origin to each group of invoices covering shipments. These certificates may be secured from the Japanese consul nearest the manufacturing city. (In the case of manufacturers in Michigan, Indiana, Ohio, and Wisconsin this is Chicago.) As the general rate of duty is 50 per cent ad valorem and the conventional duty but 35 per cent, the saving on such certificates at \$2 each is manifest. Under the conventional

# History of Cotton Airplane Fabric\*

## A Successful Substitute for Linen Developed by the Bureau of Standards in Collaboration with Airplane Engineers and Cotton Mill Experts

THE design of heavier-than-air machines during their early stages of development was arrived at by cut-and-try methods. The wings of such machines were covered with plain cotton fabric, much the same as an ordinary sheeting material, coated with a beeswax compound or some form of glue. The wing surfaces were then rubbed and polished to present a surface having a comparatively low skin friction. Such a covering was not very strong and sagged very materially when subjected to pressure and when exposed to weather.

As the application of science produced planes which were capable of much higher speeds, smaller wing surfaces, and a constantly increased loading per square foot of wing surface, it became necessary to cover them with a material having a high strength and a low weight.

It was generally known that flax spun into yarns and subsequently woven into fabrics produced a very tough material having little stretch and the property of withstanding shocks with very little permanent set.

### Linen Sheeting Very Satisfactory

Accordingly, unbleached linen fabric was used to cover the wings of planes, and found to be very satisfactory. The structure of the linen fabric is that of an ordinary fine linen sheeting. No attempts had been made to study the requirements of the covering material or to design a fabric meeting those requirements which might possibly be lighter and more resistant than the linen fabrics.

During the present crisis it became evident that the available supply of linen would not suffice the demands of the military programs of the countries at war, and it became necessary to find materials which could be used in place of the satisfactory linen.

As early as January, 1916, the Bureau started investigating the possibilities of substituting cotton for linen airplane fabrics, and found that the general consensus of opinion among airplane manufacturers and investigators here and abroad was that the use of cotton fabric for wing coverings was out of the question, as many experiments had already been made to substantiate these opinions.

However, we were certain that not all the possibilities of structure of fabric had been considered, and we began an investigation to study the stresses in a fabric on a plane and to thoroughly determine by actual measurement the properties of the linen fabric and to incorporate the desirable properties of the linen in a cotton fabric suited for the purpose.

The difficulties experienced in the experiments on cotton fabrics previous to the time of our investigations were: (a) low strength per unit of weight; (b) low tearing resistance; (c) little shrinkage upon application of dope; (d) little tendency to retain what little shrinkage they had after doping.

It was not until March 18, 1917, that we were in a position to issue instructions covering the construction of cotton fabrics for the experimental fabrics which proved to be quite successful. These instructions were sent to the various fine-goods cotton mills and were supplemented by visits of our textile experts to the mills.

At the mills our textile men sat down with the practical men and evolved the present cotton airplane fabrics. At this point I wish to mention the name of Mr. Richartson, agent of the Ponemah Mills, as he did much to make cotton fabrics a success.

The first fabrics of this series were received at the Bureau on or about the first of April, 1917, and as the series pro-

gressed we suggested changes, and during the early part of May, 1917, a fabric had successfully passed our laboratory standards. The next important problem was to determine the actual performance of these fabrics. To this end samples were placed on Army planes at Langley Field and Navy planes at Pensacola during August, 1917. Similar fabrics were later sent by the Signal Corps to the Canadian Aeroplane Company, of Toronto, Canada, and they were placed on planes the middle of October, 1917.

The results of the service tests demonstrated that the fabrics were satisfactory and that service results could be reliably predicted in the laboratory. In view of this we felt justified in modifying the structure of these fabrics, and in co-operation with R. L. Kingston, then with the Curtiss Aeroplane Co., and with A. R. Pierce of the Pierce Mfg. Co. the present Grade A cotton fabric was evolved.

It was not until August that the military authorities were becoming concerned with the scarcity of linen, and on or about the 23d of August the Joint Army and Navy Aircraft Board called the Bureau into a conference regarding cotton fabrics for airplanes, and we were able to say with a great degree of certainty that we had a fabric ready for their needs.

On Aug. 24, 1917, a conference held between the military authorities and representatives of the Bureau resulted in the Signal Corps Equipment Division ordering that the Bureau of Standards supply the necessary specifications covering the purchase of 500,000 yd. of airplane cotton fabric. The specifications were transmitted by the Bureau of Standards on Sept. 5, 1917, covering the fabrics now known as Grade A and Grade B as used by the Signal Corps and Navy. A few days later the Bureau supplied the necessary information regarding the apparatus and methods of testing and inspection.

The Department of Agriculture was invited by this Bureau to assist in further development, and the experiments were started during September, 1917, but because of some unfortunate circumstance we were unable to keep in touch with the work. During April, 1918, the Signal Corps submitted samples which we understood to be the result of these investigations. They dealt with the use of the various cottons and the experiments were very valuable.

### Adopted by the English

Recently the standard fabrics were submitted to the English airplane authorities and their comments were to the effect that the results of their tests were astonishingly successful. Since that time the English have adopted the standard Grade A fabric.

At the time we were making our field tests at Langley the Italian Aviation Mission was there. One of their planes was covered with a cotton fabric which they had used successfully on the battle front, and the members of that Mission offered the opinion that our fabrics were better than their own successful fabric. It is a peculiar thing that upon analysis this fabric differed but slightly from our own as far as thread count and yarn number were concerned. Here were two people working on the same problems, on opposite sides of the water, and having no information regarding each other's work, and the results were practically the same.

LEON MORANE, a famous French pioneer in aviation, died in Paris last month. Morane first came into prominence as a pilot of Bleriot monoplanes, and had a bad crash when starting off for a flight for a Michelin prize from Issy to the Puy de Dome in October, 1910. Later he designed a monoplane on Bleriot lines, which he built in conjunction with M. Borel.

\*From a paper by E. Dean Walen presented to the American Society of Mechanical Engineers at New York.

# Fuller & Sons Tractor Transmission

A Three-Speed Transmission with Direct Drive on Second Speed—Belt Pulley Drive Through Bevel Gears

**F**ULLER & SONS MFG. CO., Kalamazoo, Mich., a firm well known in the automobile and truck transmission field, has recently brought out a transmission gear for tractors, known as model TR-2. It is of the unit power plant type, and is designed to be fitted to four-cylinder engines up to 326 cu. in. piston displacement, which makes it suitable for both two and three-plow tractors.

In a general way the transmission is of the automobile type, and is complete with clutch and control devices. It affords three forward speeds and one reverse, but instead of the high speed being a direct drive, the intermediate speed, which is the normal plowing speed, is made the direct drive. On the first speed there is a gear reduction in the transmission box of 1.7:1; the second speed is direct, and the third speed is a geared up speed in the ratio of 1:7.

The clutch is of the multiple disc-in-oil type, and drives through case hardened nickel steel studs. The shafts are made of chrome nickel steel, of extra large diameter, and are hardened and ground. The main shaft is of the four-spline type, 1½ in. over the keys. All shafts are mounted in annular ball bearings. The reversing pinion is extra large, having 23 teeth and runs on a solid roller bearing.

All gears are made of nickel steel, case hardened. They are controlled by means of a ball-mounted, ball-handled control lever. This is made from a drop forging, and can be bent to suit customer's requirements. The shifting mechanism is so designed as to give a positive interlock, in addition to being provided with position finders.

The belt pulley shaft is driven from the secondary shaft of the transmission through bevel gears and runs at 85 per cent the speed of the crankshaft. A choice is offered of three types of bell housing—No. 2 S.A.E., No. 3 S.A.E., and Continental type N.

Both the transmission housing and the clutch housing are oiltight. The former is kept half full of heavy oil, while the clutch housing is kept one-quarter full of motor oil. Self-adjusting stuffing boxes over bearings prevent leakage of oil.

Two views of the Fuller transmission

## Fortney Measuring Wires

**T**HE Fortney Mfg. Co., 13 Franklin St., Newark, N. J., manufactures standard wires for checking up the pitch and angle of thread of screws and screw gages. In the use of these wires, two wires of a given size are placed in the thread on one side of the screw, another wire is placed in the thread at the opposite end of the screw, and a measurement over the wires is then taken by means of a micrometer. For each pitch two sizes of wires are made, a maximum wire and a minimum wire.

These standard measuring wires are used particularly in manufacturing thread gages. We understand that they are approved by the U. S. Bureau of Standards, and that of a lot of 1500 recently furnished the U. S. Ordnance Department not a single one was rejected.

The wires are guaranteed to be straight, round and accurate within .00002 in. of the required size. They are made for both U. S. Standard and Whitworth threads for all pitches from 80 per inch up.

In the line cut on this page are shown four styles in which the wires are furnished, the differences being in the ends by means of which they are handled.

The common way of using the wire, in measurements with an ordinary micrometer, is illustrated by the photograph. These wires are, however, also used with measuring machines, in which case they are suspended from a bracket or yoke, and to this end they are provided either with a hole, loop or drilled handle, as shown. The method of placing the wires in the thread is also shown in the line cut. Two wires are placed parallel in adjacent threads on the same side of the screw and the third wire is placed on the opposite side.

## Universal Joints as Shock Reducers

By C. A. Schell

Chief Engineer, The Thermoid Co.

IN addition to the fact that fabric disk universal joints and couplings require no lubrication or attention, engineers who are experimenting along these lines find they have many other advantages over the metal construction. The two most dominant are their shock absorbing and sound insulating qualities. No better argument for the shock absorbing or reducing ability need be cited than their adoption by the manufacturers of so many of the military tractor units both here and abroad. The great majority of these were of the caterpillar type, and in many of these positive types of clutches were used causing a great amount of shock to be transmitted throughout the unit. Some of these machines were used under the worst possible conditions and flexible disk connections acting as shock reducers between motor and tread were of great help.

The conditions encountered in military use are very severe, but the average motor truck is subject at times to conditions which are very trying and costly. One of these is the application of heavy chains for winter driving. Invariably five or six pieces are wrapped around a solid tire and the wedging action, especially on hard frozen ground or brick, causes a reversal of stresses from the tire to the motor which can be nothing but very harmful. Of course when a flexible connection is inserted between the two positive units, the wheel and the motor, these two can be regarded as independent or floating, as the flexibility of the disk allows this. When the wheel strikes stiff, unyielding obstacles in the road or when the clutch grabs quickly these same conditions take place, but in the writer's opinion the action of heavy chains is the worst, owing to its severity and continuity.

### Tried Out on 3-Ton Truck

In an effort to determine what effect driving chains would have on the chassis, the writer carried out several interesting road tests. Several transmission main shafts were obtained for a 3-ton truck on which the rear ends were turned down from a 1 1/4 in. S. A. E. taper to a 1 1/4 in. size. Some of these were installed in this truck and ran several thousand miles over smooth brick roads very well when no chain equipment was used on the tires. With the application of chains, however, these shafts were all fractured in less than 1000 miles each when the truck was driven over snow-covered brick and frozen dirt roads. Of course, the shafts were made small purposely for this particular unit in order to get quick comparative data. In the first runs the truck was equipped with all metal joints on both propeller shafts. In following tests the same unit was driven with chains attached under similar conditions, but equipped throughout with flexible disk joints. The shafts in these tests stood up over a mileage several times greater than with the metal joint equipment, showing conclusively the shock reducing ability of this construction. In laboratory tests also, shafting, gears, splines, etc. are found to stand several times the number of sudden shocks when transmitted to these parts through a disk connection than when run through an all metal unit.

### Seven Degree Flexing Range

In these tests disks made up by the Hardy laminated construction and consisting of 60 per cent fabric and 40 per cent rubber were used. The wind resulting from application of maximum torque was 7 deg., which can be used with good results for all automotive work. The above figures leave no question but that disk joints made up elastically enough in torsion can be used as shock reducers in addition to their function as joints, and will add much life to the chassis. The great majority of trucks equipped with worm driven and

Layout of flexible universal joint

double reduction axles have comparatively straight line drives, the shaft angle never running over 7 deg., and on such layouts the flexible joint is ideal. With the low angle the lateral movement is very small and no spline is required, consequently no lubrication whatsoever is needed. If time and care are taken in designing the metal parts and a well constructed disk is employed, a long-lived trouble-proof assembly is the final result.

### Advantage of Silent Operation

Passenger cars are not subject to the severe conditions encountered with commercial vehicles, but, nevertheless, flexibility in the drive is of great benefit. Aside from the shock resisting function the strongest argument for this construction is the elimination of greasing and all noise and backlash. Axle noise is not so objectionable at the axle in itself as is the multiplicity of the noise as it is transmitted through the propeller shaft to the frame. This can in most cases be dampened with a fabric disk so that it is practically unnoticeable. At the present time one of the five largest passenger car makers, who has been having trouble of this kind in the past, is adopting this construction on a new model, after going into this phase of it very thoroughly. Many of the lower-priced cars develop considerable backlash between clutch and wheels after about 15,000 miles of use, owing to the wearing of so many connections. This is especially noticeable when engaging the clutch. Not only does the flexible joint eliminate nine of the wearing parts, but it also makes the clutch engagement feel much softer. In other words, all this backlash is unnoticeable because the slack in all the metal parts is taken up between the two positive units (motor and wheels) gradually. The maximum load is only applied after the disk has stretched the allowable amount. This factor can best be appreciated by equipping a car with both types of joints after it has been run 15 or 20,000 miles. With the flexible disk installation it is practically impossible for the most expert drivers to detect any backlash.

### Will Be Much Used in Post-War Models

Both abroad and in this country a large number of makers have concluded tests and will use this construction on post-war models. Some of the smaller chassis will be equipped with assemblies consisting of three 6 1/2 by 1/4 in. disks, while some of the larger cars will require three disks 8 in. in diameter. For passenger car work this joint should not be used where the maximum shaft angle exceeds 10 deg. After the angle runs beyond this point the disk is under considerable lateral stress and will not have the proper life. In some cases, however, where the shaft angle is too severe for this construction some of the makers will use a flexible fabric joint at the axle end of the propeller shaft with the metal joint forward.

## The Future of Engineering Standardization

IN the past practically all engineering standards have been national standards, being used only by the nation which originated them. As a result of the war, however, it now looks as though standardization work in future would assume an international character. We need only refer to the work of the International Aircraft Standardization Committee, which bears out this point. At the present time a movement seems to be on foot to unify the screw thread systems of the United States and Great Britain. Each of these nations lately has evinced considerable interest in the other's standardization work, and at the recent meeting of the American Society of Mechanical Engineers in New York a paper on the work of the British Engineering Standards Committee was presented by Secretary Le Maistre of that committee, and a paper on the work of the committee on screw threads and limit gages was presented by Sir Richard Glaze-

brook, director of the National Physical Laboratory of Great Britain.

These events seem to forebode an extension of the scope of future standardization work. It seems logical that if there are benefits to be derived from the use of certain standards throughout a nation, the benefits would be greater if these standards were in universal use. This argument may possibly be controverted on commercial grounds. But the same objection has been made to standardization on a narrow scale and has proven entirely untenable. Some manufacturers object to using standards because it enables the customer to purchase repair parts in the open market instead of compelling him to buy them from the maker of the machine. The customer, however, objects to being limited to a single source for parts of such character as are in general use. Thus, while the exclusive use of special, non-standardized parts may result in increased parts sales it introduces a certain amount of sales resistance which outweighs the advantage accruing from it. It has thus been proven conclusively that national standardization will not act to the detriment of the individual firm and similarly it may be assumed as certain that international standardization would not result in the injury of any nation.

### English and Metric Standards

The great obstacle to the adoption of universal standards at the present time is the use of two different systems of weights and measures, the English and the metric system. Of course, it is quite possible to express any standard whatever it may be in both systems of measures. For instance, the S. A. E. screw standard can be readily translated into metric measures, but whereas in the inch system most of the figures used in the enunciation of this standard are integers or common fractions, in the metric system irrational fractions would have to be used. The standard is therefore distinctly an inch standard, though it can be expressed in metric terms.

In the aircraft standards published by the International Aircraft Standardization Committee while it was sitting in Washington last winter, all dimensions, stress allowances, etc., are given in both inch and metric units, but whereas many of the English dimensions are in round figures all the metric dimensions are in three-place decimals. Many of these aircraft standards had been worked out by the S. A. E. and merely adopted by the International Committee. It appears that the International Committee has been dissolved and that what aircraft standardization work is being done now is being carried on by national committees. Another international meeting is planned for next year, however, at which time the standards adopted by the various national committees will, no doubt, be proposed for adoption as international standards.

International standardization work will undoubtedly receive full consideration during the period of readjustment. It will probably take one or the other of two possible forms: Either the standards will be formulated in metric measures and will find substantially universal application, or the two countries using the English system of measures, Great

Britain and the United States, will unite in evolving a common system of engineering standards, to strengthen their commercial position in competition with metric countries in the export fields. The move to unify the screw thread standards of Great Britain and the United States is indicative of the tendency in the latter direction.

Probably the closest approach to a universal engineering standard to be found at the present time is the annular ball bearing standard. This is a combination metric and English standard, as the ball diameters are given in fractions of an inch, whereas all dimensions of the races are given in millimeters. The chief magneto dimensions, so far as mounting is concerned, including shaft height and location of base screw centers, are another instance of a universal standard. On the whole there seems to be greater readiness to adopt metric standards in countries using the English units than English standards in metric countries.

## "The Spirit Maketh Alive"

THE attitude of capital and labor toward each other changes slowly. But that it is changing, and changing for the better, there can no longer be any doubt. Until the change becomes universal we will always have internal strife and a high rate of labor turnover.

That apt old adage to the effect that "you can't teach an old dog new tricks" probably fits the case better than any other homely analogy, and accounts in no small measure for the slow shift in attitude which is apparent.

It is the new blood, the younger generation that has seen the situation in its true light and that is leading the procession toward a true recognition of the rights—or better let us say, the just due—of both.

These are the men who are first to recognize that workers are not slaves, that they are human beings with human cravings and human grievances.

And it is these men who are slowly but surely opening the eyes of their predecessors to the need of applying the Golden Rule in the treatment of men.

John D. Rockefeller, Jr., voiced the modern attitude of capital toward labor when he said last week at Atlantic City: "*The letter killeth; the spirit maketh alive.*" The older generation of employers did not, and in too many cases do not, believe this truism—or it may be they have never thought about it. At any rate, theirs has been the law of the letter rather than the law of the spirit.

"... only as the parties in industry are animated by the spirit of fair play, justice to all and brotherhood, can any plans which may be mutually worked out succeed," said Mr. Rockefeller.

That is not only good sentiment to subscribe to; it is an economic truth. Confidence is the basis of all work which requires mutual operators, and it is established not by control but by understanding.

Only the tradition of the years prevents this universal belief becoming universal practice.

## Tractor Engine Cooling

IT is not an uncommon sight to see a tractor steaming at the radiator while hauling a plow, indicating that its cooling system is of insufficient capacity. Designers do not always realize that on a tractor an unusual amount of radiating surface is required. This is so, partly because the speed is very low and does not induce appreciable air circulation through the radiator, and partly because kerosene is usually the fuel burned, which, on account of incomplete vaporization previous to ignition, is slower-burning and entails a greater loss of heat to the water jacket. Not only must a tractor radiator have more cooling surface per engine horsepower than an automobile radiator, but it must be of more robust construction, owing to the severe vibration to which it is exposed. Owing to the need for heavier construction it is impossible to get as much cooling surface into a given space, and a tractor radiator is not only heavier but also bulkier than an automobile radiator.

In the past radiators have been fitted to tractors largely by the cut and try method. The problem of radiator size required is naturally a rather complex one, as a considerable number of factors are involved, and the lack of experimental data made it almost impossible to determine the proper size without extensive experimentation. What was needed was the development of a rational formula permitting of expressing the capacity of the system for dispersing heat as a function of factors which are easily fixed or determined. Naturally such a formula would involve a constant, the value of which would depend upon the core construction employed.

In an article in another part of this issue by Mr. Goldberger a formula intended to serve this purpose is derived, giving the cooling surface required per horsepower under different conditions of operation. The equation is simpler than most radiator capacity formulæ that we have seen. The only difficulty we can see in connection with its application is that the rates of air and water circulation cannot be predetermined with any degree of accuracy without having a radiator of the type to be used available for tests. This, of course, means that we must still cut and try, though the formula ought to be an aid to our judgment after the constant for the type of core to be used has once been determined.

Undoubtedly considerable opportunity for the immediate sale of automobiles is offered by the small neutral countries of Northern Europe. During the war these countries prospered materially, but owing to embargoes and scarcity of shipping they were unable to secure all the cars they wanted from abroad. These countries do not have to face the same problems of reconstruction and readjustment as the belligerents and they will therefore be first in the market for cars.

Already there are signs that these opportunities are not being neglected by our export houses and manufacturers.

## 50,000-Mile National Highway Proposed at Chicago Conference

Cost to Be \$25,000 per Mile and Road System to Reach Fully 90 Per Cent of the Population—Federal Money to Be Furnished and Administered by National Highway Commission

CHICAGO, Dec. 11—*Special to AUTOMOTIVE INDUSTRIES*—A National Highway Commission to build with Federal money a system of national highways was the proposal made to-day before the joint meeting of the association of State Highway officials and the Highways Industries Association. The meeting is the first of a series extending over three days, and held for the purpose of placing the doctrine of Federal Highways administered by a Federal Commission before Chambers of Commerce, Rotary Clubs, State Highway officials and the general public.

The meeting has drawn together nearly one thousand delegates, and from the sentiment apparent at the initial sessions the conference will go on record as strongly favoring the appointment of a National Highways Commission with power to allocate Federal money for a system of interconnecting state roads which shall in effect become a great national highway.

The meeting applauded loudly and long when E. J. Mehren, vice-president of the Highway Industries Association, laid down as the platform of the gathering the building with Federal money of a national highway embracing fifty thousand miles, to cost twenty-five thousand dollars a mile and to reach fully ninety per cent of the population of the United States. It was brought out that such a system would give each state at least two highways and that the entire cost might be spread over a period of twelve and one-half years. The opinion of the meeting is that the importance of our highways has reached the point where it requires the attention and administration of a National Highways Commission.

The sentiment is strong that both our legislators and the public have reached the place where the development of good roads cannot be stopped, and in view of that fact the most rational course is to so direct such a move that the maximum benefit may be realized. This it is believed, can only be brought about through the appointment of a National Highways Commission. Both Fourth Assistant Postmaster Blakslee and Roy D. Chapin, former chairman of the highways transport committee, strongly favored the development of national highways by the Federal Government. Chapin urged the necessity of adequate regulation of

rural motor express lines which might use such highways, and came out in favor of exclusive franchises for individual lines. He carried the matter up a point further by suggesting that the National Highway Commission should have as one of its jobs the investigation of the use of public roads with a view to educating the public to their advantages and stimulating their use.

At a preliminary meeting of the Association of State Highway Officials action was taken empowering a committee to prepare a bill comprehensively covering the entire road program and advocating the appointment of a National Highways Commission. In the meantime this association will get behind the matter of Federal aid for state road building.

At to-day's session George M. Graham, president of the Pierce-Arrow Motor Car Co., will present a draft of a uniform vehicle law to cover both motor and horse drawn vehicles and including regulation, registration, weights and so forth. The measure is intended to eliminate present difficulties when vehicles cross state lines and thereby become subject to entirely different sets of state laws. Following is the text of a resolution presented before the meeting to-day which typified the prevailing sentiment. It will come up for action at to-day's session:

Resolved that a Federal Highway Commission be created to promote and guide this powerful economic development of both highways and highway traffic and establish a national highways system.

Be it further resolved that the present appropriations for Federal aid to the States be continued and increased and the States be urged to undertake extensive highways construction so as to keep pace with the development of this country and its transportation needs.

Be it further resolved, that all Governmental aid with respect to highways be administered by the Federal Highways Commission.

### Patternmakers' Wage Scale Agreed

WASHINGTON, Dec. 12—The National War Labor Board, following the review of the case between the Patternmakers Association of Detroit, and the 19 firms involved, which include Maxwell Motor Co., Swedish Crucible Steel Co., Wolverine Pattern Works, and 16 other pattern

companies, has ordered a wage scale of 95 cents per hr., dating from Aug. 29, 1918, to the journeymen patternmakers, with the recommendation that this rate be increased to \$1 per hr. following Nov. 22, 1918, actual payment to be made accordingly not later than Jan. 1. The board further suggested that both employers and employees be governed by the right of workers to organize in unions and bargain collectively and the right of employers to organize associations and bargain collectively. That employers should not discharge workers for membership in trade unions. That workers should not use coercive methods or measures to induce people to join their union. That in establishments where union shops exist, they be continued and the union standard maintained throughout.

### New Washington Section S. A. E. Criticizes Army Truck Methods

WASHINGTON, Dec. 11—Col. James Furlow presided at the first meeting of the newly established Washington section of the Society of Automotive Engineers held to-night.

A. A. Gloetzner, chief engineer of the Covert Gear Co., who was a member of the Commission sent to France to aid the A. E. F. Motor Transport Corps, told of truck experience overseas and criticized the methods of shipment, the shortage of trucks and the scarcity of skilled drivers. He stated that 214 makes of trucks embodying 600 types and more than 4,000,000 parts formed the American Army equipment and that it was almost impossible to provide efficient repair service.

Trucks in great numbers, said Gloetzner, were always laid up waiting for repairs; thousands were smashed owing to the fact that they were carried overseas as loose deck cargo and many were ruined through the ignorance of their drivers. He added that trucks played a vital part in winning the war, instancing the fact that at Chateau Thierry 81,000 men were hauled 175 miles in 32 hr. in convoys of as many as 500 trucks each.

### Roy D. Chapin Resigns from Highway Transport Committee

WASHINGTON, Dec. 11—*Special to AUTOMOTIVE INDUSTRIES*—Roy D. Chapin has resigned as chairman of the Highways Transport Committee, a position he has held for more than a year. He is leaving immediately for Detroit to take up again his duties as president of the Hudson Motor Car Co. His work on the Highways Transport Committee will be taken up by John S. Craven. George H. Pride has also resigned from the committee.

# Automotive Industries □

## Truck Parts Makers' Position Critical

**Heavy Stocks Have Been Bought and Paid For—Government Settlement Delayed**

WASHINGTON, Dec. 10—The situation with truck parts makers is particularly critical inasmuch as many of them, after receiving their orders for the last series of 25,000 B trucks, purchased large quantities of supplies for which they have paid and settlements for which will probably not be made by the Government for 6 or 8 months. This means that unless a part of the order for this last series of B trucks is revived, and at least 7500 allowed to be made, parts makers must wait until probably the summer or fall of 1919 before they can receive the money they have invested in anticipation of Government work.

In order to overcome this the parts makers and truck assemblers have organized and are placing their case before Government authorities and particularly before the Motor Vehicle Section of the Quartermaster Department. There are reports current that orders for 7500 B trucks applying to the last series may be revised, but there has been no action in this connection yet.

### Selden Revises Truck Prices

ROCHESTER, N. Y., Dec. 11—The Selden Truck Sales Co. has revised its present list prices, the new schedule coming into effect on Jan. 1, 1919. Present and new chassis prices follow:

Model	New Price	Present Price
TXR 1-ton; int.-gear drive..	\$1,900	.....
TWL 1-ton; worm drive.....	2,200	\$2,100
JCB 2-ton; int.-gear drive..	2,750	.....
JWB 2-ton; worm drive.....	3,050	2,950
NL 3½-ton; worm drive.....	3,850	3,650
DL 5-ton; worm drive.....	5,000	4,950

### War Industries Board to Quit

WASHINGTON, Dec. 6—That the War Industries Board will be completely abolished on Jan. 1, 1919, was made evident by the release of Bernard M. Baruch's letter of resignation by the White House. In this letter Mr. Baruch advised President Wilson that the War Industries Board would terminate all activities on Jan. 1, turning over those divisions which should continue permanently. The Conservation Division, which has had charge of such work as limiting the sizes of automobile tires, will come

under the Department of Commerce. The division on petroleum and its products will be turned over to the Bureau of Mines. It can be expected, therefore, that all restrictions on industries of whatever nature excepting those which were formulated by the Conservation Division, will be terminated and that 100 per cent production can be engaged in by all industries and companies.

## Tractor Makers Free from Restriction

**All Curtailments of Material and Limitations on Manufacture Are Removed**

DETROIT, Dec. 11—B. F. Sprankle, president of the American Tractor Association, has received a wire from Judge Edwin B. Parker, Priorities Commission, Washington, D. C., which authorizes him to notify the members of the American Tractor Association that all restrictions on the manufacture of tractors and all curtailments on tractor material have been removed from and after Dec. 9.

### Control of Steel to Cease Jan. 1

WASHINGTON, Dec. 12—The Government control of steel, including price regulations, will be entirely removed Jan. 1, the War Industries Board announced definitely to-day, following conferences with the American Iron & Steel Institute. Steel prices after that date will be determined by the industry on the former competitive basis. Foreign shipments of steel and the present embargoes are likely to be kept up.

### 80,000 Trucks Sent Abroad

NEW YORK, Dec. 9—Approximately 80,000 American motor trucks have been sent abroad, and it is believed unlikely by the National Automobile Chamber of Commerce that any of these will be returned to this country. At present there are about 45,000 trucks en route or on order for the Government and about 7500 in use by the Army and Navy in this country. The N. A. C. C. believes that few, if any, of these will be offered for sale, and that if they are offered the sales will be widely distributed to prevent disturbing conditions in any one locality. Similarly, it is believed that no more passenger cars will be required by the Army and equally unlikely that any of those now in use will be disposed of.

## Truck Orders Not Canceled

**Post Office Increases Requisition from 10,500 to 15,700 Vehicles**

WASHINGTON, Dec. 10—The Post Office Department has increased its requisition with the War Department for motor trucks from 10,500 to 15,700, and as a result it is now expected that the orders for commercial trucks placed with the Locomobile, Pierce-Arrow, Packard, Garford and White companies will not be canceled.

Truck orders placed by the Government and still in force include the second series of B 3-ton standardized trucks, totaling 8000; trucks for Nash Quads and 4-wheel-drive trucks, totaling 12,000; orders for Locomobile, Pierce-Arrow, Packard, Garford and White, total approximately 18,000 trucks, and other contracts for 10,000 trucks placed with the Federal, Gramm-Bernstein, Hurlburt, International Harvester, Kelly-Springfield, Moreland, Republic, Standard and Velie companies. It is now reported that the 18,000 commercial trucks on order with the first five named companies will stand and the 10,000 on order with the last named concerns will be allowed to run to Jan. 1, 1919, and those not completed at that time will be canceled. It is also expected that the orders for Nash and Four-Wheel-Drive trucks will be reduced somewhat.

The contract for the 800 B trucks will be completed.

Many of the truck manufacturers and also a number of the parts makers who have been particularly interested in the standardized trucks are facing serious troubles if cancellations are further engaged in.

### Appropriation for Post Office Aerial and Truck Services Recommended

WASHINGTON, Dec. 10—An appropriation of \$2,185,000 for purchase of airplanes and maintenance of air line mail service for the Post Office Department is recommended in the Post Office Appropriation Bill reported to the House to-day. This is an increase of \$1,185,000 over the \$300,000 originally estimated by the Department. The committee also recommends an appropriation of \$1,000,000 for motor truck mail service, which is \$700,000 more than the \$300,000 authorized in the act of June 2, 1918. The Post Office authorities asked for \$1,500,000 for motor truck service.

## Highways Transport Work Reviewed

### Annual Report of Council of National Defense Deals with Automotive Section

WASHINGTON, Dec. 6—The annual Report of the Council of National Defense which is just out includes a review of the work of the Highways Transport Committee, the Automotive Products Section, the Commercial Economy Board, and other divisions, some of which were later in the year made a part of the War Industries Board. The review of the work by the Highways Transport Committee includes complete discussion of the assistance between that committee and the War Department in convoy service, its development of highways transport resources, activities for snow removal from highways, expansion of store-door delivery and return loads bureaus, and its co-operative work with the Food Administration in the development of rural motor express.

#### Control of Products Section

The Automotive Products Section, the report states, controlled during the year the allocation of Government business and purchases of the Government and the Allies of motorcycles, motorcycle side cars, motor cars, motor trucks, motor truck bodies, motor truck tractors, motor truck trailers, armored cars, military tractors, military tanks, marine gas

engines, automotive accessories and airplane parts.

The report tells in detail of the development of the class B truck, drawings of which were started in December, 1917, as a result of the co-operation between the Quartermaster Corps and the Society of Automotive Engineers.

The first two of these trucks, says the report, were completed and run on their own power to Washington on October 10, arrived October 14, and were accepted by the Secretary of War on October 19. The Automotive Products Section advised the Government and the Allies as to the allocation of more than \$400,000, 000 worth of apparatus.

#### Shortages Caused Trouble

During the year two shortages occurred, one of magnetos for trucks, tractors and airplanes, due to shortage of platinum, and, second, a shortage of wireless apparatus, due to lack of mica. Producers, importers, jobbers and users of this were called together and steps were taken to conserve the platinum, while at the same time domestic mica was discovered which was equivalent to any India mica for electrical apparatus.

On April 18, says the report, the Conservation Division arranged with the rubber industry for a reduction in the numbers, sizes and types of automobile tires from 287 to 282 immediately, and by gradual steps during the next year to 9 sizes and types. This, adds the statement, will result in economy in production and make a large reduction in the quantity of inactive stocks in the hands of manufacturers and dealers.

## U.S. October Exports Show Decrease

### Limitation of Ocean Transport Undoubtedly Chief Cause—Improvement Anticipated

1918					
Cars	Value	Trucks	Value	Parts	Value
Oct. 1,708	\$1,881,462	737	\$2,192,556		\$3,709,687
Sept. 3,305	2,593,236	1,280	3,215,206		3,441,758

1917					
Oct. 5,536	4,581,127	1,359	4,422,268		3,045,192

WASHINGTON, Dec. 9—Exports of automotive products—cars, trucks and parts—during the month of October were valued at \$7,774,705 as against \$9,250,200 for September and \$11,848,577 for the month of October, 1917.

There are several reasons for the drop. Consignments which were shipped in October were, obviously, ordered long before there were indications of a cessation of warfare, and even during the month of shipment ocean transport was much restricted, the bulk of available tonnage being diverted to the carrying of men, munitions and food. This was the case, in a measure, a year ago, when our exports were much greater than recently. On the other hand, a year ago there was a much more urgent need of both cars and trucks for war service and to relieve railroads of congestion.

Investigation has shown that the falling off in automotive products export has not been caused by lack of orders but by the strict limitation of shipping facilities.

## October Exports from New York

### Great Falling Off in Cars and Trucks—Parts Show a Slight Increase

NEW YORK, Dec. 9—October exports of automotive products from this port are disappointing when compared with those for the previous month. In September the total value of cars, trucks and parts exported was \$4,721,391; the figure for October being but \$3,266,216. This represents a drop of \$1,455,175, equal to approximately 30.8 per cent.

Passenger cars show a decrease of almost 43 per cent in number for the month and their value is nearly 30 per cent below that of the cars exported in September. Trucks have fallen off to an even greater extent, the reduction being over 61 per cent in number and over 57 per cent in value. Parts have increased 22 per cent in value in comparison with September figures.

Under present shipping conditions it is hardly fair to compare any individual month with another. As a matter of fact it would be quite correct to state that at this time our exports are restricted by lack of transport rather than by any shortage of orders.

In considering the October figures it is of interest to observe that automotive products have been exported during the month to Iceland, Morocco, Japanese China and Portuguese Africa. Russia in Asia and Turkey in Asia are also buyers for the first time for a considerable period.

#### 65,870 Cars in Kentucky

LOUISVILLE, Dec. 6—The motor car in Kentucky experienced its most prosperous year in 1918, despite the war and restrictions on production. The actual increase in registration was 18,454 for the year. There are now 65,870 motor vehicles in use in the Bluegrass State. At present there is one car for every thirty-five persons in Kentucky.

To give an idea of the growth in Kentucky the passenger car and truck registrations by years since 1911 are given herewith:

1911.....	2,868	1915.....	19,500
1912.....	5,147	1916.....	31,700
1913.....	7,210	1917.....	47,416
1914.....	11,746	1918.....	65,870

#### 500-Mile Race May 30

INDIANAPOLIS, Dec. 7—There will be a 500-mile race at the Indianapolis Motor Speedway this coming year. May 30 is the date; \$50,000 is the purse. This announcement comes from C. G. Fisher, J. A. Allison and A. C. Newby, owners of the Indianapolis course.

## Modify Australian Import Rules

### Exporters Must Give Value of Products "for Home Con- sumption"—Other Rules

WASHINGTON, Dec. 8—Passenger car and truck makers exporting to Australia should prepare immediately, states a commerce report, to comply with the requirements concerning invoices and customs declarations which go into force on Jan. 1, 1919. After that date all invoices for goods dutiable at an *ad valorem* rate from all countries other than China and Japan must contain a separate column showing the fair market value for home consumption in the country of export, at the date of invoicing to Australia, of similar goods in similar quantities. The heading of this column should be as follows:

Domestic value f.o.b. ("port of export" or "factory" or as the case may be) at date of invoicing to Australia, subject to .... per cent discount for cash and in(ex)cluding cost of domestic outside casing.

The prescribed form of declaration of value to accompany the invoice, as given in Statutory Rules No. 216 of 1918, varies only slightly from that given in Commerce Reports of Feb. 16, 1918, but it should be used in preference to that previously given, and for convenience it is here reprinted in full. Correction should also be made of paragraph 3 of the form of declaration printed on page 19 of Tariff Series No. 37 (Customs Tariff of Australia). The declaration is to be written, stamped, typewritten or printed on the back of the invoice.

The complete form of the declaration of value is as follows:

I, ..... (here insert manager, chief clerk, or as the case may be), of ..... (here insert name of firm or company), of ..... (here insert name of city and country), the manufacturer or supplier of the goods enumerated on this invoice, amounting to ..... (here insert value), have the means of knowing and do hereby declare:

1. That the said invoice is in all respects correct and true;

2. That the said invoice contains a true and full statement showing the prices actually paid or to be paid for the said goods, the actual quantity thereof, and all charges thereon;

3. That the price shown in the invoice in a separate column represents the actual price at the date of this declaration of equal quantities of identically similar goods to any purchaser for home consumption in this country;

4. That no different invoice of the goods mentioned in said invoice has been or will be furnished to anyone; and

5. That no arrangement or understanding affecting the purchase price of the said goods has been or will be made or entered into between the said exporter and purchaser or by anyone on behalf of either of them either by way of discount, rebate, salary, compensation, or in any manner whatsoever other than as shown in the said invoice.

Dated at ..... this ..... day of ..... 19...  
Witness ..... Signature .....

In the case of goods covered by an invoice being consignment (not an outright sale), the following clause should be substituted for paragraph 2:

2. That the said invoice contains a true and full description of the goods, the actual quantity thereof, the amount debited therefor, and all charges thereon to free on board at port of shipment as known up to the date of invoice.

## Report on Transport and Aviation

### 82,500 Trucks, 16,000 Cars and Many Trailers Completed for Army

WASHINGTON, Dec. 9.—The annual report of the Secretary of War for the fiscal year ending June, 1918, includes in its statement reports on the Motor Transport Corps, tractors and aviation. The Motor Transport Corps personnel, states the report, totals 2700 officers and 77,000 men. This is exclusive of the Motors and Vehicle Division of the Quartermaster Corps, which is in charge of purchase and procurement. Automotive equipment carried over for the fiscal year 1918 amounted to \$353,000,000.

The appropriations for motor transportation for the fiscal year ending June 30, 1919, totaled \$886,000,000, of which \$350,000,000 has been expended or will be expended on contracts which cannot be canceled. A further expenditure of \$29,000,000 will be necessary for the repair-shop and equipment program and additional expenses incident to demobilization and liquidation of the vehicles left on hand are estimated at \$6,000,000. Equipment which will be carried over into the fiscal year 1920 represents an expense of \$732,000,000.

#### 55,000 Motor Vehicles Overseas

To date, states the report, 82,500 standardized and commercial types of trucks, 16,000 motor cars, 27,000 motorcycles, 22,000 bicycles and a great number of trailers have been completed for the Army. There are on hand overseas more than 55,000 motor vehicles. Seventeen thousand five hundred motor vehicles were shipped to the American Expeditionary Forces in October, while there were available for shipment on Nov. 1, 1918, 12,000 additional motor vehicles.

The convoy service of the United States, although formed primarily for training purposes, states the report, has since its organization transported more than 14,500 trucks overland, a greater part of which carried freight in the shape of spare parts and motor equipment.

The Motor Transport Corps had on hand at the time of the report a balance of \$501,698,824 from appropriations.

Truck production for the fiscal year of 1918 totaled 82,490 trucks and other motor vehicles amounted to 65,482.

That section of the report dealing with aviation, after enumerating figures which have already been published relative to production, states that at the cessation of hostilities there were 17,000 cadets graduated from ground flying schools, 6528 men training as aviators, 8602 reserve military aviators graduated from elementary training schools and 4028 aviators who had completed the advanced training course. In addition 14,000 mechanics had been graduated from training schools.

On Sept. 30, 1918, there were 32 squadrons composed entirely of American personnel at the front, of which 15 were pursuit, 13 observation and 4 bombing.

Reports of air casualties show that 2 aviators lose their lives in accidents for each aviator killed in battle. The report on battle fatalities up to Oct. 4 were 128 and the overseas accident fatalities 244, while the fatalities at training fields in the United States totaled 262. The Air Service, which in April, 1917, comprised 65 officers and 1120 men, at the signing of the armistice totaled 190,000, of which there were 20,000 commissioned officers, 6000 training cadets, 164,000 enlisted men and 11,000 other flyers. The Air Service constituted over 5 per cent of the total strength of the Army.

## Vincent, Vindicated, Returns to Packard

### Exonerated and Thanked for Services in Presidential Announcement

WASHINGTON, Dec. 9.—Commended by the President of the United States for his services to America in time of national need, and vindicated on all his acts in the speedy production of a military aviation engine for the United States forces, Lieut.-Col. Jesse G. Vincent has received an honorable discharge from the Army and has returned to take charge of Packard engineering, the work he left in June, 1917, to enter Government service.

"The President believes that the two gentlemen concerned, Lieut.-Col. Geo. W. Mixer and Lieut.-Col. J. G. Vincent," says an executive announcement made public at the White House on Dec. 3, "were entirely innocent of any improper or selfish intentions, that their guilt was only technical, and that their services to the Government, which have been of the highest value and of the most disinterested sort, deserve a cordial recognition."

#### Overland Prices Drop

DETROIT, Dec. 6.—The Willys-Overland Co. has decreased the prices of all its models, excepting the No. 88 eight-cylinder passenger car. The new price list follows:

Model	New Price	Old Price
90, Touring .....	\$985	\$1,095
Willys-6, Touring .....	1,625	1,775
88-4 .....	1,725	1,925
90, Sedan .....	1,495	1,665
88-4, Sedan .....	2,750	2,950
88-4, Coupe .....	2,650	2,850
90, Delivery .....	1,000	1,045

#### Allen Prices Down \$100

FOSTORIA, OHIO, Dec. 7.—The Allen Motor Co. has reduced the prices of its cars \$100 each, effective Dec. 2. New and old prices follow:

Model	New Price	Old Price
41 .....	\$1,195	\$1,295
Sedan .....	1,695	1,795

## Goodyear Profits Are Record

### Gross Sales for Year Amount to \$131,000,000—Net Profits Are \$15,388,190

AKRON, Dec. 7.—Although President F. A. Seiberling in his report of the year's business ending Oct. 31, 1918, pointed out to the stockholders of the Goodyear Tire & Rubber Co. that the net profits were materially reduced by the fact that Government business (approximately 15 per cent of the total volume) was handled at a considerably lower percentage of profit than was the company's regular business, he was able to show gross sales of \$131,000,000 and net profits of \$15,388,190.74.

Preceding year's gross sales were \$20,000,000 below the 1918 figures and profits were \$14,044,216.10.

Examination of the balance sheet discloses the fact that a year ago the company had in excess of \$15,000,000 notes payable outstanding. This item has been liquidated by the sale of \$15,000,000 of 8 per cent preferred stock to over 16,000 stockholders composed almost entirely of customers and employees.

At the annual meeting all the directors were re-elected, as follows: F. A. Seiberling, C. W. Seiberling, G. M. Stadelman, F. H. Adams, P. W. Litchfield, H. B. Manton and J. P. Loomia. The directors in turn elected the following officers: F. A. Seiberling, president and general manager; C. W. Seiberling, vice-president and manager of purchases; G. M. Stadelman, vice-president and manager of sales; P. W. Litchfield, vice-president and factory manager; A. F. Osterloh, secretary; W. E. Palmer, treasurer and assistant secretary; H. J. Blackburn, assistant treasurer.

## Fordson Men Attend Sales Conference

Over 100 Distributors Meet at Tractor Plant to Discuss Prospects and Policy

DETROIT, Dec. 9.—A 100 per cent representation of Fordson distributors attended the sales conference at the Fordson tractor plant in this city on Thursday, Friday and Saturday of last week. Of distributors and executive men in their employ more than 100 were here. The conference was devoted almost exclusively to an open discussion of the prospects for the coming year and the policy which would be pursued by the distributors' association in handling it. No definite action was taken on many of the things affecting policies, but committees were appointed from among the members of the association which will take these matters under investigation and report conclusions to Henry Ford & Son for final decision.

Probably, as far as the distributors are concerned, the official recognition of the association by Henry Ford & Son was the most important outcome of the conference. C. E. Sorensen, in addressing the conference, said that the firm of Henry Ford & Son was heartily in accord with the principles underlying the organization, and that henceforth it should receive the approval and hearty co-operation of the company. Matters affecting the distribution of the tractor will be referred to the association and handled through committees, subject to the approval of the officials of the company, who are recognized as honorary members of the association and who constitute practically an executive committee with final authority.

It was decided at the conference that there will be no immediate change in the price for the Fordson tractor, which will continue at \$750, f.o.b. Dearborn, as heretofore. About the only change from past custom in this respect was the agreement by Henry Ford & Son to ship tractors in carload lots hereafter, payable upon delivery and not with sight draft attached to bill-of-lading, as has been the custom.

The kind and quality of service which the dealers shall render on Fordson tractors was discussed exhaustively. The real purpose in calling the conference to Dearborn instead of the meeting which had been scheduled for Chicago was to impress upon the distributors as a body the obligation that they and their sub-dealers owed to the country at the present time to do all they could to further agricultural operations.

The consensus of opinion of the distributors was that free service should be limited practically to delivery and to starting the tractor with preliminary instructions of the farmer in operation, subsequent service to be charged for at rates depending upon local conditions. The recommendation was made that in

all cases where it was necessary to supply spares, the local service man make an investigation to determine whether the breakage was due to the fault of the operator or to mechanical defects. This would determine the charge which should be made.

Regarding the equipment which will be used with the tractor, while it was not made conditional upon the distributors, still it is understood that if they sell equipment at all, it will be only such as has received the approval of Mr. Ford. An implement committee was appointed to consider the merits and claims of all operative equipment, both in the line of tillage tools and belt power machinery, and then to recommend the adoption of such implements as meet the requirements. Final decision will rest with the officials of the factory after considering the recommendation of the committee.

Regarding the character of the dealers who had been most successful in the distribution of tractors, the opinion was almost unanimously expressed that the Ford motor car dealers had proven their efficiency in this respect. They are prompt and efficient in service, loyal to the company and enthusiastic.

### Ford Entertains Visitors

The visitors were entertained by Henry Ford & Son with a dinner at the Detroit Athletic Club, followed by a motion picture entertainment showing the activities of the Ford organizations, a dinner at the Hotel Statler and an evening at the Garrick Theater.

As indicative of the production at the Fordson plant, the total number of complete tractors turned out for the week ending Dec. 7 was 852. These were divided into daily production as follows: Monday, 153; Tuesday, 174; Wednesday, 164; Thursday, 184; Friday, 177. In addition, 791 transmission housings, 582 engines, 797 rear axles and 778 front axles were produced.

### After American Agencies

WASHINGTON, Dec. 7.—The Bureau of Foreign and Domestic Commerce, Department of Commerce, has requests from Colombia for the agency for automobiles and trucks. Further information can be secured by addressing the Department of Commerce, referring to Foreign Trade Opportunity No. 27743. The Department also has an inquiry from Peru, desiring an agency on a commission basis for the sale of farm tractors, automobiles, accessories and oils. Further information can be secured from the Bureau of Foreign and Domestic Commerce by referring to Foreign Trade Opportunity No. 27748.

### Mitchell Prices Are Dropped

RACINE, Dec. 9.—The Mitchell Motors Co. has revised the prices of its cars and returned them to pre-war basis as follows:

Model	New Price	Old Price
B-40	\$1,275	\$1,465
C-42	1,525	1,735

## U.S. Russian Bureau Organized

War Trade Board Forms Company to Aid in Stabilizing Economic Situation

WASHINGTON, Dec. 9.—The War Trade Board of the U. S. Russian Bureau, Inc., is a company which has been organized by the War Trade Board at the direction of the President for the purpose of helping the Russians to help themselves in stabilizing the economic situation in Russia. It has a capital stock of \$5,000,000, all of which has been issued and fully paid in cash out of Government funds. The stock is owned in its entirety by the United States Government.

The company will engage in the business of exporting to Russia and Siberia agricultural implements, shoes, clothing and other commodities which the Russian population need, bringing back Russian and Siberian raw materials in return. The company thus is intended to aid in supplying the needs of the people of Russia, in encouraging Russian production and trade, and assisting in the marketing of Russian products in America and their exchange for American goods.

One of the chief objects which the company will have in view will be the encouragement of private capital to engage in trade in Russia and Siberia as shipping becomes available for the purpose. Its policy will be to co-operate with, encourage and promote such trade with Russia as will assist in the rehabilitation of her economic life, and to cover by its direct operations only such portions of the field as cannot at present be served readily by private enterprise.

The company has already begun the transaction of business by the dispatch of three vessels from the Pacific Coast to Vladivostok carrying commodities which its representative in Siberia has designated as being most urgently needed there.

By addressing the Russian Bureau persons interested in Russian trade may receive more detailed information as to the commodities most needed by Russia and the commodities likely to be available for export from Russia. Additional vessels will from time to time be scheduled, and shippers are urged to file applications for licenses to export to Russia such commodities as they know to be needed.

The head office of the Russian Bureau is in the War Trade Board Building at Washington, D. C. The board of directors of the company consists of the members of the War Trade Board. Hon. Vance C. McCormick, chairman of the War Trade Board, is president of the company; John Foster Dulles is secretary and treasurer, and Henry B. Van Sinderen is acting manager. The directors are Vance C. McCormick, Thomas L. Chadbourne, Jr., Edwin F. Gay, Albert Strauss, Alonzo E. Taylor, J. Beaver White and Clarence M. Woolley.

# Incorrect Hitching Neutralizes the Work of the Tractor

Speakers at the Meeting of the Minneapolis Section S. A. E. Emphasize the Importance of Proper Hitches and Plow Implements for Power Farming

MINNEAPOLIS, Dec. 5—The tractor man doesn't realize the importance of the implement, according to F. N. G. Kranick, speaker at the meeting last night in the Hotel Radisson of the Minneapolis Section, S. A. E. Mr. Kranick is in charge of the implement division of the Hyatt Roller Bearing Co., Chicago, and is most of the time in the field. His subject was: "Drawbar Implements and Hitches." Prof. J. L. Mowry, of the University of Minnesota, presided.

"The tractor is an incidental means to the end. If there were not another tractor in the world we would get along, but without implements we would starve," said Mr. Kranick as a basis of his attitude to the subject. In brief the speaker said:

"Implements to go with tractors as a whole apparently have not had the consideration due them. It is really the implement that does the work the farmer has to do. Really it is the work that is being done by the implement that makes the success for the tractor as a whole. It is no uncommon thing to see tractors sold for work done by the plow. The implement is part of this big problem that we have to work out. I believe the sooner we all realize the implement has an important function in common with the tractor the better it will be for the industry as a whole.

## Hitching Cause of Trouble

"Much of the trouble is the way the implement is hitched. The implement really does what we have to do. The history of nations is the history of its farm machinery, which governs the growth of agriculture which we must have to live. Since 83 per cent of farm work is machine work, farm machinery must receive more consideration from tractor makers. The implement really is first. The tractor is a means to an end to get more out of the implement and to use larger units and do more in the same time. Due to the development of machinery one man can do the work of 3 men in 1880.

"To-day is the fourth period of agriculture, or farm power. Farm power is part of agriculture. Plowing is "the peak of the load" in agriculture. It takes more power to plow the wheat fields than the power of all the industries for the same period.

"The tractor is doing away with the slow work of the walking plow. The type of plows is not varied so much as before. One manufacturer told me he had had 50 types of bottoms to fit the territory in which they were sold. With the tractor this has simmered to four. Many manufacturers have the flexible beam type, and there is the rigid beam

mounted on one frame and they travel together. It is found that where land is irregular and a constant depth is required the flexible type gives best satisfaction. It is harder to adjust and as it comes knocked down requires a good man to set it up.

"The rigid beam to-day is quite simple. The bottoms vary with what the farmer has to do. A plow has a certain work to do—to make the mold board such a shape as to turn one particle of the soil on another and mellow it. Sometimes with use of the stubble bottom instead of the general purpose the quality of the plowing is affected favorably.

"The hitch frequently defeats all the work of the tractor manufacturer. At the Salina demonstration this was apparent at quite a distance, as from the top of a stack, whence it was quite evident. The problem is to know just where to hitch to get the best results.

## Implement Should Be Watched

"When we get a tractor with plows in the field we are apt to watch the tractor and overlook the implement altogether. Ordinarily of the draft on a plow 55 per cent is used to cut the furrow, 35 per cent in friction and 10 per cent to lift the load of the total draft. It is important that the plow run true and it is a good scheme to know when it is running right. The load on all three of the wheels of the plow should be equal, and whether this is true can be found by holding to see whether the rear wheel, which is usually the wrong one, slips on the ground. The tractor operator can easily adjust the rear wheel. To give the tractor a good show have the proper hitch and proper adjustment of the plow at tractor demonstrations.

"The number of plows a tractor can pull is a problem. In some places it is 3 lb. per sq. in. per furrow section, and in Illinois 20 lb. and in sections in the West twice that.

"It is difficult to find an operator who understands the hitch of the plow. It is important that the plow is set so the tractor can do its very best, so two-plow tractors in cases can pull three plows. The center line of draft on plows is often talked about as a mystery. Some people have assumed the center line of draft is 2 in. on the inside of the land side of the plow, or the point of resistance.

Rather than to assume this Professor White made tests which I witnessed with a drawbar hitched from one wheel on the outside to a wheel on the inside with holes every 2 in., with a dynamometer, to see where the pull was easiest. It ran lightest when hitched the poorest, to one side, but the quality of

the plowing was awful. It revealed the importance of getting two units coupled up in harmony. This shows the engineers should give the unit consideration in the field as in the shop on the brake. What they do in the field is the final analysis to the whole thing.

"Never in public tests is any record kept of draft, so far as the hitch is concerned. This is important because one tractor can have a real good performance and a real poor performance, according to the test. If the manufacturer publishes figures of a test this item of hitch should be part of it.

"If a plow is set properly nine-tenths of the troubles of plowing will be eliminated. The industry as a whole will gain more if it gives more consideration to what is the tractor hitch to suit the implement."

## Center Line of Draft

In reply to a question from A. W. Scarratt as to where he found the center line of draft with the experiments, Mr. Kranick said the figures were so different from what they expected to find that it threw the whole thing into the air. They tried to find the point of resistance with the plow.

It was a little over 2 in. inside of the land side; for 2 plows 19 in., 3 plows 26 in., 4 plows 33 in. Professor Mowry asked what the effect was on the plow.

The speaker said that if the land side is rubbing on furrow there should be  $\frac{1}{4}$  in. to  $\frac{1}{2}$  in. clearance. The plow should not drag on the furrow so as to take the load off the wheels. C. F. Shoop asked what about higher plowing speed and what it is. Mr. Kranick said the manufacturers have no idea about it. Some had plowed 5 m.p.h., which hurt the tractor more than the plow. A general purpose bottom is better for high speed than stubble bottom. There is no speed set at which a plow should work for a good season's work, but 3 to 3½ miles steadily is good. One who plows along steadily gets along better. The S. A. E. standard of 2 1/3 miles is too slow. Plowing should really be 3 to 4 m.p.h. The average of the new light tractors is about 3 miles, but not for 3 or 4 plows. It all comes back to efficient speed of the tractor—the economic value as to whether fast or slow speed is the efficiency of the tractor, whether it will stand up.

## More Money for Wisconsin

MILWAUKEE, Dec. 9—The Wisconsin Motor Mfg. Co., which in recent years has become one of the largest and best known manufacturers of passenger car, truck and aircraft engines in the world, has increased its capital stock from \$1,000,000 to \$2,000,000 in order to accommodate the growth of its business and to provide for future extensions of facilities and trade. Within the last year and a half the size of the plant at Forty-fourth Avenue and Burnham Street, in West Milwaukee, has been nearly doubled. Charles H. John is president and general manager, and A. F. Milbrath is secretary and chief engineer.

**Seger Heads U. S. Rubber**

NEW YORK, Dec. 9—Charles B. Seger has been elected president of the U. S. Rubber Co., succeeding Samuel P. Colt, who becomes chairman of the board of directors. Mr. Seger is president of the Union Pacific Railroad Co. and for the past two years has been a member of the board of directors and of the executive committee of the U. S. Rubber Co. Lester Leland, for many years vice-president of the U. S. Rubber Co., was elected vice-chairman of the board of directors.

**Combs Enters Canadian Prest-O-Lite**

TORONTO, Dec. 8—R. H. Combs has become the general manager of the new Canadian company organized as the Prest-O-Lite Co. of Canada, Ltd., which will perpetuate the service of the Prest-O-Lite Co., Inc., in the Dominion.

The new company starts business with a capital stock of \$800,000. It also operates plants for the manufacture of Prest-O-Lite compressed acetylene at Shawinigan Falls, Que., at St. Boniface, Man., and at Merritton, Ont. The welding and cutting equipment is made and marketed from the Toronto plant. In addition warehouses and an office are maintained in Montreal and a sales office in Winnipeg.

**Dr. Garfield Resigns**

WASHINGTON, Dec. 6—Dr. Harry W. Garfield, Fuel Administrator, has tendered his resignation to President Wilson. The President accepted it. This announcement was made yesterday at the White House together with the statement that the Fuel Administration will continue, however, to operate until winter has passed. No announcement of modification of fuel restrictions or of any contemplated changes in the present policies of the Administration were made in connection with the statement.

Frank A. Storer has resigned as general manager of the Wire Wheel Corp. of America to return to his former activities in the foreign market field. The first of the new year will find him exconced as junior partner of the Argentine firm known as Storer & Co., with headquarters at 361 Calle Chacabuco, Buenos Aires, to re-engage in the business of importing American goods.

Rex W. Wadman, who has been doing special work for the Ordnance Department, U. S. A., has re-established his New York office at 16 Beaver Street.

**St. Louis Picks Landing Field**

ST. LOUIS, Dec. 8—The city officials last week designated a site in Forest Park for the airdrome and landing field of the airplane mail service which is to be established between this city and Chicago in January if the War Department can release to the Postoffice Department sufficient airplanes by that time.

## Men of the Industry

### *Changes in Personnel and Position*

**Lonn Heads Falls Motor**

MILWAUKEE, Dec. 9—At the annual meeting of stockholders of the Falls Motors Corp., Sheboygan Falls, Wis., the following officers and directors were elected: President, E. J. Lonn, head of the Great Western Mfg. Co., LaPorte, Ind.; first vice-president, P. A. Waller, Kewanee, Ill.; second vice-president, L. G. Blessing, of Bastian & Blessing Co., Chicago, and Muskegon, Mich.; general manager, G. G. Brandenburg, formerly of the Buda Co., Harvey, Ill. Directors—H. W. Ladish, Milwaukee; C. Testwuide and William Wilms, Sheboygan Falls. The Falls company is completing a new shop addition which will go into operation Jan. 1 and make possible a considerable increase in output. The addition represents an investment of more than \$250,000 in plant and equipment. The company is bringing out a new tractor motor to supplement its line of passenger car and truck engines, which it has been making and marketing for more than 15 years.

L. E. Schumacher, who for the past 8 years has been chief inspector of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., has been promoted to works manager of the Krantz Mfg. Co., Brooklyn, N. Y., the latest subsidiary of the former company.

J. K. Mahaffey, who has been representing the Edison Storage Battery Co. in Washington in connection with Government business, has been appointed district sales manager of the Pittsburgh district.

Bertram Smith, for the past 3 years district sales manager of the Detroit district of the Edison Storage Battery Co., has been appointed assistant general sales manager, with headquarters at the main office, Orange, N. J.

Lieutenant Thurber W. Cushing has been transferred to the inactive list of the Field Artillery Officers' Reserve Corps, and has returned to his duties as vice-president and sales manager of the Maibohm Motors Co., Racine.

Homer Hilton, formerly with the Class Journal Company, has joined the Oshkosh Motor Truck Mfg. Co., Oshkosh, Wis., as sales manager.

Gard Gale has accepted the general sales managership of the Commerce Motor Truck Co., Detroit.

**Toback Returns to New York**

NEW YORK, Dec. 9—Samuel S. Toback, who some months ago left New York to become president of the Redden Motor Truck Co., Chicago, has returned to New York to become general sales manager of the Marmon Automobile Co. of New York. This company, which controls the Metropolitan distribution of Marmon cars, has just added similar distribution of the Hupmobile, which up to recently was handled by Charles E. Reiss. Toback will have charge of both wholesale and retail sales of both lines.

**Lipsner Out of Air Mail**

WASHINGTON, Dec. 7—Capt. B. B. Lipsner has resigned as superintendent of the Aerial Mail Service. Capt. Lipsner objected to the assignment of "novices" in charge of important air work, and stated, "I wish to resign and keep spotless my record as first superintendent of the Aerial Mail Service."

**Alden Takes Horowitz's Place**

WASHINGTON, Dec. 4—Col. H. W. Alden has become assistant to the Chief of Ordnance in charge of motors, including tanks, following the resignation of Louis J. Horowitz, who was the assistant to the Chief of Ordnance in charge of tanks during the war. Mr. Horowitz resigned his position to resume his duties as chief executive of the Thompson-Starrett Construction Co. He was in complete charge of the engineering, manufacturing and inspection of military tanks.

Pablo Homs has been appointed assistant foreign sales manager for the Cleveland Tractor Co., Cleveland, with offices at 44 Whitehall Street, New York. The countries to which he will give special attention in the distribution of Cleveland tractors are Russia, Scandinavia, Holland, Dutch East and West Indies, Spain, Portugal, Japan, China, Manchuria, Philippines and Corea.

**Truck Show for Philadelphia**

PHILADELPHIA, Dec. 7—At a meeting of the board of directors of the Motor Truck Association of Philadelphia it was decided that the association will hold a show in March, following the show of the Philadelphia Automobile Trade Association. The motor truck show will be held under the direction of a committee consisting of the officers and directors. J. D. Howley is president of the association.

**Tractors for Snow Removal**

HARRISBURG, PA., Dec. 7—For the first time in the history of Pennsylvania, tractors will be used for the removal of snow from the highways. The State Council of National Defense will turn over several of the state's big farm tractors used in the fields the past season for the use of the State Highway Department.

## British Day at S. A. E.

### Metropolitan Section Hears Paper on Transmission by English Engineer

NEW YORK, Dec. 11—To-day was British Day at the Metropolitan Section of the S. A. E., beginning with an afternoon reception to the Council of the Society at which the speakers and the nature of the subjects for the coming winter meeting, which has been postponed until February, were discussed, and ending with a combination British engineering talk and French movies in the evening, with a satisfying dinner, including cider, sandwiched in between. All three events took place at the clubhouse of the A. C. A.

The principal speaker was F. Leigh Martineau, a British engineer, associated with Hele-Shaw, who gave an interesting talk on hydraulic transmissions. Owing to sickness he had not been able to prepare as complete a paper as he wished, but he dealt clearly with the fundamentals governing the use of hydraulic transmissions in general and the construction and operation of the Hele-Shaw oil transmission in particular, illustrating the latter with lantern slides. His experience, which has extended over several years, has been largely with the application of oil transmissions to other than vehicle uses, such as ship-steering gear, hydraulic cranes and presses, but his vision of the future developments of this simple form of power transmission includes the vehicle field. As an example of its ruggedness the speaker referred to an oil operated press which had been in use in a French munition works from 1914 until 1917, working night and day throughout that period without any repairs or replacements. Some interesting results of tests for economy of hydraulic as compared with steam steering gears for ships were given, showing a great saving of fuel consumed and even an increase in the speed, owing to smoother ruddering, of the same ship when fitted with hydraulic steering.

Remarkable figures of efficiency in the operation of oil transmission when full power is transmitted over a small speed range were also given. There is the limitation, however, that if a great range of speed is required at the output end this efficiency is considerably lowered.

As an example of an application of hydraulic transmission where its superiority over other types is very marked mention was made of large hydraulic cranes in use at the munition plants in England and France. The advantages are especially noticeable in the lowering of heavy loads, near the maximum of the crane. In the hydraulic crane this can be accomplished with almost perfect control and without any vibration, whereas friction-controlled lowering is accompanied with great danger, owing to the impossibility of applying smooth braking effort.

In the absence of Major Crossley, who was to address the meeting, C. G. Griffin of the British Mechanical Transport made a felicitous speech in which he expressed the gratitude felt by the British engineers for the great services rendered by their American confrères in the mechanical work of the war.

Harold L. Pope, who has lately returned from a tour of the aircraft factories in France and England, recounted his experiences briefly.

The meeting closed with a visionary expression of the future work of the society by President Kettering.

## Two New York Shows in February

### Dealers' Association Will Hold Car and Truck Exhibits in Madison Square Garden

NEW YORK, Dec. 9—Instead of having no show New York is to have two shows. The old double-show days are coming back under the auspices of the Automobile Dealers' Association of New York City.

After much negotiation the dealers have secured the Madison Square Garden, where the motor show was born a score of years ago, and will put on shows for both cars and trucks. The passenger cars will be shown Feb. 1 to 8 and the trucks Feb. 10 to 15.

Those who used to attend shows under the Garden's vaulted roof will remember that extra floor space used to be secured by extending the balcony out over the main floor. This plan will be again followed, so that the floor space will be about as it was in the old days before the shows left the Garden to go to Grand Central Palace, which is now a military hospital.

Space arrangements are being made and within a short time the exhibition areas will be allotted to the New York dealers.

Some of the personal machinery of the former shows is retained and the campaign for big, successful shows is being pushed actively by Manager Charles A. Stewart and the show committee, which consists of: Chairman, Charles H. Larson, Cutting-Larson Co.; H. R. Bliss, Colt-Stratton Co.; Walter Woods, Van Cortland Vehicle Co.; William C. Poertner, Poertner Motor Car Co.; Harry J. DeBear, Maxwell Motor Sales Co.; R. J. Gilmore, Packard Motor Car Co.

### Director of Bureau of Public Roads Dies Suddenly

CHICAGO, Dec. 10—Logan Waller Page, director of the Bureau of Public Roads, died suddenly of heart disease last evening. He had arrived to take part in the Highway Industries Association convention. Mr. Logan was a pioneer in highway work and the inventor of machines used in road improvement.

## Electric Starter on All Ford Sedans

### "Liberty" to Be Furnished Exclusively to Ford—Slight Increase in Price

NEW YORK, Dec. 7.—The new Ford sedans are to be equipped with an electric starter, and there will be a slight change in the price of the cars to cover the installation. The starter will be standard equipment for 1919 on as many cars as it is possible to obtain starters for. There are to be no mechanical changes in the Ford chassis except for some slight alterations made necessary to accommodate the starter.

Information regarding this radical departure from previous practice of the Ford Motor Co. comes to AUTOMOTIVE INDUSTRIES from an authentic source. Rumors to the effect that Ford contemplated a change of this character have been current many times during the past 2 years, and at one time it is known that a starter actually was developed and negotiations carried to the point where its equipment on all Ford models was practically assured. Later, however, difficulties arose which precluded the possibility of its addition.

### Starters Supplied for Tanks

The starter which is to be used is one which has been developed and is now being produced by the Liberty Starter Co., which was organized originally to build starters for the Government, and obtained a contract for 16,500 of them. A number of these have been furnished for use on government tanks and other automotive equipment in the American Expeditionary Forces. Latterly the Government contract has been canceled, and it is understood that the Ford Motor Co. has contracted to absorb the entire output of the factory.

The Liberty Starter Co. occupies a factory of moderate dimensions, and its present output is approximately 500 starters a day. Another building of the same size is to be built immediately and the output more than doubled. The starter will be supplied exclusively to the Ford Motor Co.

### Court Decides in Stewart Favor

CLEVELAND, Dec. 10—In a decision handed down Nov. 21, Judge Westenhaver of the United States District Court, held that the Jay Patent, No. 1,132,273, dated March 16, 1915, and on which the Stewart vacuum system is based, is infringed by the Sparton tank made by the Sparks-Withington Co., Jackson, Mich. Infringement is held on two out of fourteen or fifteen claims of the Stewart-Warner Co. On the other thirteen points it was held that the Sparton tank did not infringe. An injunction and accounting of damages and profits was granted Stewart-Warner against Sparks-Withington.

# Accomplishments of the Aircraft Production Board

**John D. Ryan's Report Shows That Though There May Have Been Some Inefficiency Quantity Production Was Being Rapidly Approached**

WASHINGTON, Dec. 9—When in May, 1918, the Senate was denouncing the Air Service because of "defects in the Liberty engine," "insufficient production," etc., there had been delivered 1104 Liberty engines, 1794 foreign combat engines and 6377 training engines, according to the annual report of John D. Ryan (May 24 to June 30, 1918) made public here to-day.

Up to May 24 148 battleplanes and 5091 training planes had been produced. The report shows clearly that the Air Service, although in some degree possibly inefficient, was undoubtedly entering into quantity production and headed for the production scale provided by the program. Instruments, accessories, machine guns, bombs, photographic equipment and balloons were all in a production that was growing steadily.

The Bureau of Aircraft Production was divided, states the report, into seven divisions—executive, engineering, production, spruce production, procurement, finance, advisory and consulting. A special mission of French and Italian engineers had been brought to this country and was engaged in the development of experimental plans. Spruce production totaled over 56,000,000 ft. up to May 24, while fir shipped up to that date amounted to 19,216,000 ft.

Total appropriations made by Congress for aviation amounted to \$682,646,067.16. Orders for airplanes and spare parts, balloons, plans, general equipment, instruments and engines totaled \$570,437,818.52 to June 30,

1918. Construction of buildings, flying fields, and training and operation and maintenance to June 30 totaled \$181,312,821.72, making a total of obligations incurred of \$751,750,640.24.

Cash disbursements to June 30, 1918, for airplanes and parts, engines and parts, balloons, general equipments, plants and experiments totaled \$208,419,894.53, and for building and flying field construction, training, operation and maintenance there was expended \$164,898,494.11, making a total of cash disbursements up to June 30, 1918, of \$370,318,388.64.

At that time, when Congressmen and others were denouncing the "wasteful" disposal of the \$640,000,000 appropriated for aviation, in the latter part of May—there had actually been expended but \$182,292,373.39 for airplanes, spare parts, engines and spare parts, balloons and accessories, general equipment, plants and experiments, and at that same time there had been delivered more than 9200 Liberty, foreign combat and training engines, over 6000 training and battle planes, 14,000 propellers, millions of feet of mahogany, walnut, spruce and other necessary woods, 34,000 machine guns and many thousands of other accessories of vital importance to the aircraft program.

Following is the complete report of the Bureau of Aircraft Production from May 24 to June 30, 1918, after the appointment of John D. Ryan to head the Bureau until the end of the fiscal year:

## Complete Text of the Report of the Bureau of Aircraft Production

JOHN D. RYAN, DIRECTOR.

(May 24 to June 30, 1918)

### 1—Creation of the Bureau of Aircraft Production

Under date of May 20, 1918, by Executive order of the President and by General Order No. 51 of the War Department, the Bureau of Aircraft Production was established.

The bureau was described as "an executive agency" which "shall exercise full, complete and exclusive jurisdiction and control over the production of airplanes, airplane engines, and aircraft equipment for the use of the Army."

The order provides that such person as shall at the time be chairman of the Aircraft Board shall also be the executive officer of the Bureau of Aircraft Production. He is designated as "Director of Aircraft Production," and the order provides that he shall, under the direction of the Secretary of War, have charge of the activities, personnel and properties of said bureau.

### 2—Aircraft Board

From the date of the creation of the Aircraft Board by act of Congress approved Oct. 1, 1917, to May 24, 1918, the Aircraft Board acted in an advisory capacity to the Secretary of the Navy and to the Chief Signal Officer of the Army, with respect to the purchase, production, and manufacture of aircraft, and made recommendations as to contracts and their distribution in connection with the foregoing.

The Navy has continued to function in its relations to the Aircraft Board in substantially the same manner as heretofore.

The board acts as a clearing house for information regarding aviation as between the Army and the Navy. The Executive order of May 20, 1918, which gave to the Bureau of Aircraft Production the jurisdiction and control of the production of airplanes for the Army, recognizes the existence of the Aircraft Board in designating the chairman of that board as head of the Bureau of Aircraft Production, and neither enlarges nor diminishes the duties and functions of the board.

The Aircraft Board consists of the following:

Civilian Members—John D. Ryan, chairman; R. F. Howe, vice-chairman, and W. C. Potter.

Army Members—Maj. Gen. W. L. Kenly, Col. E. A. Deeds and Col. R. L. Montgomery (last two temporarily relieved).

Navy Members—Rear Admiral D. W. Taylor, Capt. N. E. Irwin and Lieut. Commander A. K. Atkins.

### 3—Organization of the Bureau of Aircraft Production

In order to carry out the program and provide the equipment, the bureau is divided into seven main divisions:

- (a) Executive.
- (b) Engineering.

- (c) Production.
- (d) Spruce Production.
- (e) Procurement.
- (f) Finance.
- (g) Advisory and Consulting.

The Executive Division directs the activities of the bureau. The Engineering Division is responsible for the design of new models of airplanes and engines and all accessory equipment, necessary to meet the military requirements, and when developed to furnish models and drawings to the production department for the producing of quantities called for by the program.

The Production Division is charged with responsibility for the supervision of the production and inspection of all aircraft, including materials and parts therefor, for the investigation and selection of sources of supply, and for the conduct of all relations with contractors, with the exception of the production engineering, the execution of contracts, and matters of financial administration.

The activities of the Production Division are carried on by decentralization through district offices, which are established in various sections of the country where concentrated aircraft production is being carried on. By this means direct contact with the manufacturers is obtained and decisions can be rendered with the least possible delay.

It is of interest to note that aircraft requirements emanate from the Director of Aircraft Production for complete planes, engines and accessories, and are set forth in an authorized program furnished by the Office of the Secretary of War, which states that certain types of airplanes and airplane engines in certain monthly quotas of each type are required, these types having previously been determined largely by the Air Forces overseas.

In connection with production, it is of interest to note what has been accomplished:

#### Airplane Engine Production

	Total shipments to May 24.	Shipments May 24 to June 30, inclusive.	Total to June 30, inclusive.
<b>Liberty engines:</b>			
Army type .....	622	994	1,616
Navy type .....	482	293	775
Total .....	1,104	1,287	2,391
<b>Foreign combat engines:</b>			
Gnome .....	179	30	209
Hispano-Suiza 150-hp. ....	1,607	581	2,188
Hispano-Suiza 180-hp. ....		6	6
Hispano-Suiza 300-hp. ....	2		2
LeRhône 80-hp. ....	6	62	68
Total .....	1,794	679	2,473
<b>Training type:</b>			
Curtiss OX5 .....	4,258	1,216	5,474
Hall-Scott A7a .....	2,053	130	2,183
Lawrence .....	66	48	114
Total .....	6,377	1,394	7,771
<b>Grand total engines.....</b>	<b>9,275</b>	<b>3,360</b>	<b>12,635</b>

The foregoing figures show shipments from the factory.

In addition to this production, a certain percentage of spares have been included in the shipment of each type of engines.

Combat engines, consisting of the Hispano-Suiza 180-horsepower and the Liberty 12 are in large quantity production, while the Hispano-Suiza 300-horsepower and the Liberty 8 are approaching actual production, and the output of each plant is being pushed to the utmost limit, as it is realized that this country is called upon to supply a large percentage of the requirements of the allies in addition to equipping planes which are produced in this country. Sufficiently extensive tests of these engines have been made to warrant a feeling of assurance that they will be satisfactory in service.

#### Battleplane Production

Total battleplanes produced to May 24, 1918.....	148
Total battleplanes produced May 24 to June 30, 1918.....	393

#### Training Planes

Total training planes produced to May 24, 1918.....	5,091
Total training planes produced May 24 to June 30, 1918.....	523

In addition to this shipment of planes there is a percentage of approximately 80 per cent parts shipped as spares for battleplanes and approximately 100 per cent as spares for training planes.

In order to show in further brief detail what has been accomplished in developing the manufacturing resources of this country in quantity production, a list is given herewith showing in part orders now placed and quantities shipped first up to May 25, second up to June 29, 1918.

Articles or material	Quantity Ordered up to—		Quantity Freightd up to—	
	May 25	June 29	May 25	June 29
<b>Service planes:</b>				
Observation and day bombing—

Some idea may be gained from this list of the task of developing and getting into production the various products required by the Air Service, most of them never before having been produced in this country and representing a new art, to develop which both engineers and skilled workmen have to be trained and made proficient.

The manufacturers selected are entitled to the greatest credit for the co-operation and activity they have shown in turning over their existing facilities, and in many cases adding to these facilities in order to meet the requirements.

Recognition is also given to the hearty assistance accorded this bureau by other Government departments.

#### Special Allied Missions

A special French Engineering Mission and a special Italian Engineering Mission have been brought to this country and are now engaged in the development of experimental planes of various types, which will be carefully tested and put into immediate production if satisfactory to the Air Service. The

manufacturing facilities of this country are being rapidly developed for the production of complete battle planes in quantity, and also for the production of finished parts, which will be sent overseas for assembly.

#### 4—Spruce Production Division

The output of spruce on the Western Coast is being rapidly increased, and in order to give an intelligent picture of the methods in bringing about these results, the following figures on output are of particular interest:

Spruce		Feet
Total spruce shipped up to May 24, 1918.....		56,711,044
Total spruce shipped May 24 to June 30.....		8,413,548
Grand total spruce shipped.....		65,124,592
Fir		
Total fir shipped to May 24, 1918.....		19,216,012
Total fir shipped May 24 to June 30.....		6,181,737
Grand total fir shipped.....		25,397,749

Of the total shipments of spruce 2,530,824 feet were shipped direct to England from the southern district.

Of the total fir shipped, 7,055 feet consisted of wing beams completely finished.

Spruce Production Personnel		
	On May 24	On June 30
Commissioned personnel .....	459	538
Enlisted personnel .....	12,382	17,697
Civilian personnel .....	71	70
Total .....	12,912	18,305

#### Spruce Production Cut-up Plant

In addition to the activities of the spruce production division in getting spruce through regular lumber camp channels, a cut-up plant has been located on a Government reservation at Vancouver, Wash. Work on this cut-up plant was begun December 24, 1917, and completed February 7, 1918.

The inception of the idea of a cut-up plant to supplement the sawmills was due chiefly to the necessity of manufacturing rived cants by those not having sawmills. The cut-up plant is now being used for the manufacture of airplane lumber from the entire log.

Machinery of the most modern type has been secured and scientific methods of manufacturing aircraft material adopted. Circular head saws are being used in four of the six units of the mill, and band saws in the other two.

The logs and rived cants are shipped to the plant and are handled by the band saws, and the other units take the flitches from the sawmills in the woods. It is estimated that the cut at the mill can be run up to 9,000,000 feet per month.

In this plant the logs are cut to dimensions, which does away with the waste incident to transporting lumber across the country.

#### Dry Kiln

A dry-kiln plant of the Tidman pattern has been erected adjacent to the cut-up plant. The tremendous amount of material lost through checking in transportation and improper kiln-drying methods has been done away with by the installation of this plant. It is estimated that the saving in freight will pay for the erection of this plant within 12 months.

The plant consists of 24 modern kilns, each having a charge capacity of about 30,000 feet. The time of drying depends upon the size and condition of the wood, averaging from 12 to 30 days. The output of the dry-kiln plant averages 40,000 feet daily.

#### 5—Finances

Total appropriations, obligations, and disbursements as of May 31, and June 30, 1918, for all aviation purposes and not confined to production:

Appropriations			
Increase for aviation, Signal Corps, 1918.....			\$640,000,000.00
Signal Service of the Army, 1917-18, aeronautics act June 15, 1917 .....			31,846,067.16
Signal Service of the Army, 1918, aeronautics act May 12, 1917 .....			10,800,000.00
Total .....			\$682,646,067.16
Obligations			
	To May 31, 1918	June 1 to June 30, 1918	Total to June 30, 1918

<b>Total .....</b>	<b>\$185,292,375.39</b>	<b>\$23,127,519.14</b>	<b>\$208,419,894.53</b>

Construction of buildings and flying fields, including purchase and lease of land, United States and abroad.....	To May 31, 1918	June 1 to June 30, 1918	Total to June 30, 1918
.....	\$57,642,578.62	\$4,666,352.26	\$62,308,930.88
Training, operation, and maintenance .....	82,335,163.18	20,254,400.05	102,589,563.23
<b>Total .....</b>	<b>\$139,977,741.80</b>	<b>\$24,920,752.31</b>	<b>\$164,898,494.11</b>
<b>Grand total .....</b>	<b>\$325,270,117.19</b>	<b>\$48,048,271.45</b>	<b>\$373,318,388.64</b>

It is of particular interest to note that there has been disbursed in cash up to June 30 a total of \$208,419,894, covered by Air Service material, and a total of \$164,898,494 for buildings, flying fields, training, and maintenance. Of this amount there have been cash disbursements of approximately \$1,000,000 for experimental work on engines and planes at the McCook Experimental Field, Dayton, Ohio, and a cash disbursement of approximately \$350,000 up to June 30 for special gas at the Fort Worth, Tex., Experimental Plant. In addition to this, there has been a total expenditure of approximately \$200,000 in completing the development of the present battle planes so as to take advantage of American manufacturing methods and quantity production.

### 6—Personnel

One of the most difficult problems which continually faces the director of this bureau is the securing of the proper personnel to carry on the activities of this very specialized industry, about which so little was known in this country at the time war was declared. With the other activities of the Government, the problem grows more serious each day.

In order to convey an idea of what this problem is, a detailed set of statistics is given showing the enlisted, commissioned and civilian personnel—first, in Washington, and, second, in the district offices or plants where aircraft is being produced.

These figures show an increase in personnel from May 24 to June 30 of approximately 24 per cent.

### 7—Special Missions

In order to carry out a thorough study of European production of airplanes, engines and accessories, a special mission was sent overseas in June, 1918. This mission consisted of experienced experts from the United States on engines, planes, electrical equipment, contracts, instruments and accessory apparatus.

The necessity for continued liaison service between France and this country increases daily, but with the rapid training of the men responsible for the direction of the various departments this situation should be materially improved.

An invitation on the part of the allies has been given to the manufacturing plants of the United States to send their officers and plant managers to Europe to study European methods and adopt from their practice what will be of advantage to supplement American methods.—W. C. POTTER, Acting Director of Aircraft Production.

NEW YORK, Dec. 10—Trading with the Latin American Republics has been conducted under many difficulties during the past three years, more especially during the periods when every available vessel was transferred to transatlantic service. Despite the shipping shortage and the many formalities surrounding export business in wartime plus the shortage of both material and labor, our exports of cars and trucks to Latin America have shown a steady increase.

Comparing 1918 figures with those of

## 3 Years' Exports to Latin America

Despite Shortage of Ocean Transport Our Trade With Republics Has Increased Satisfactorily

1917, it is found that while the 1918 increase in number of passenger cars exported is but slightly in excess of 7.7 per cent, their value has increased no less than 37 per cent. This increase is partly due to higher prices, but it is also indicative of the Latin American demand for cars of more expensive types. As compared with 1916, the 1917 figures show an increase of 52 per cent in number and 76 per cent in value.

Truck exports, although not as great as they should be, also show gains.

## ENGINEERING

### S. A. E. Meetings 1919

- Jan. 8—Minneapolis Section, S. A. E.—Hotel Radisson. "Governors for Tractors and Truck Engines."
- Jan. 12, 13, 14—New York. Winter Meeting, Society of Automotive Engineers, Engineering Societies' Building.
- Feb. 5—Minneapolis Section, S. A. E.—Hotel Radisson. "Radiator Cooling Fans."
- March 5—Minneapolis Section, S. A. E.—Hotel Radisson. "Tractor Service and Sales."
- April 2—Minneapolis Section, S. A. E.—Hotel Radisson. "Implements Designed for Tractor Belt Power and Their Characteristics."

## MOTOR SHOWS

- Dec. 12-14—Dallas, Tex. Dallas Automobile Trades Assn.
- January—Detroit, Mich. Detroit Automobile Dealers' Assn. H. H. Stuart, Manager.
- January or February—Milwaukee, Wis. Milwaukee Auto Trade Assn. Bart J. Ruddle, Manager.
- Jan. 24-30—Milwaukee, Wis. Eleventh Annual, Milwaukee Automobile Dealers, Inc., Auditorium. Bart J. Ruddle, Manager.
- February—Grand Rapids, Mich. Grand Rapids Automobile Business Assn. E. T. Conlon, Manager.

- Feb. 15-22—Louisville, Ky. Louisville Auto Dealers' Assn.
- Feb. 15-22—Newark, N. J. N. J. Auto Exhibition Co. Calude Holgate, Manager.
- Feb. 15-22—Minneapolis, Minn. Northwestern Automotive Exposition, Overland Building.
- Feb. 15-22—Minneapolis, Minn. Minneapolis Auto Trade Assn. Walter B. Wilmot, Manager.
- Feb. 17-22—Des Moines, Iowa. Tenth Annual, Des Moines Automobile Dealers' Assn. C. G. Van Vleet, Manager.
- Feb. 17-24—Passenger Cars; Feb. 24-27, Trucks—South Bethlehem, Pa. Lehigh Valley Auto Shows Co. J. L. Elliott, Manager.
- March—Philadelphia, Pa. Philadelphia Automobile Trade Assn. Passenger cars.
- March—Motor Truck Assn. Trucks.
- Mar. 3-8—Columbus, O. Columbus Automobile Show Co. Memorial Building. W. W. Freeman, Manager.
- March 3-8—Buffalo, N. Y. Buffalo Automobile Dealers' Assn.
- March 10-10—San Francisco, Cal. Motor Car Dealers' Assn. G. A. Wahlgreen, Manager.
- March—Boston. Boston Automobile Dealers' Assn. Chester I. Campbell, Manager.
- Second or third week March—St. Louis, Mo. St. Louis Auto Mfrs. & Dealers' Assn. Robert E. Lee, Manager.

- March 22-29, Passenger Cars; April 1-5, Trucks—Brooklyn. Brooklyn Motor Vehicle Dealers' Assn. I. C. Kirkham, Manager.
- Third week March—Trenton, N. J. Trenton Auto Trade Assn. John L. Brock, Manager.
- Probably February—New York. Automobile Dealers' Assn. Charles A. Stewart, Manager.
- Probably March—Chicago. Chicago Automobile Trade Assn.
- March—Philadelphia. Philadelphia Automobile Auto Trade Assn. A. L. Maltby, Manager.
- March—Pittsburgh. Automobile Dealers' Assn. of Pittsburgh. John J. Bell, Manager.
- March—Syracuse, N. Y. Syracuse Automobile Dealers' Assn. Harry T. Gardner, Manager.
- March—Utica, N. Y. Utica Motor Dealers' Assn. W. W. Garabrant, Manager.
- Large March or early April—Cleveland, Ohio. Cleveland Auto Show Co. Fred H. Caley, Manager.
- April 5-12—Montreal, Can. Automobile and Used Car Exposition. T. C. Kirby, Manager.
- Not decided—Bridgeport, Conn. Auspices of City Battalion. B. B. Steiber, Manager.
- Not decided—Harrisburg, Pa. Harrisburg Motor Dealers' Assn. J. Clyde Myton, Manager.

- Not decided—Hartford, Conn. Hartford Automobile Dealers' Assn.
- Not decided—Indianapolis, Ind. Indianapolis Auto Trade Assn. John B. Orman, Manager.
- Not decided—Kansas City, Mo. Kansas City Motor Dealers' Assn. E. E. Peake, Manager.

## TRACTOR SHOWS

- Feb. 10-15—Kansas City, Mo. Fourth Annual Tractor Show. Sweeney Building. Kansas City Tractor Club. Guy H. Hall, Sec.
- Feb. 18-22—Wichita, Kan. Annual Mid-west Tractor and Thresher Show. Wichita Tractor and Thresher Club. Forum.

## CONVENTIONS

- Dec. 16, 17, 18—Chicago. Convention, National Association of Automobile Accessory Jobbers. (Directors and Committees, Dec. 16; General Sessions, Dec. 17-18.)
- Dec. 30-Jan. 1—Chicago, Ill. Twelfth Annual Meeting American Society of Agricultural Engineers. J. W. Dickinson, Secretary. Ohio State University, Columbus.
- Jan. 12-14—New York. Meeting, Society Automotive Engineers.
- Feb. 25-28—New York. Sixteenth Annual Convention. American Road Builders' Assn.

## Congress Deals with Price Fixing

### Recommends Establishment of Government Agency to Abolish Evils

WASHINGTON, Dec. 8—The establishment of a Government agency by Congress is recommended by the Federal Trade Commission to abolish the existing evils of price cutting and price maintenance. An agency is to be organized which will maintain the records of commodities produced throughout the country together with the resale prices on them and which will review the resale prices and the terms of the contracts between the producer and the dealer.

If the prices and contracts are found agreeable it will mean that the dealer must abide by the resale price established. If the resale price and contract are not found satisfactory they will be adjusted between the Government agency, the producer and the dealer.

The object of this proposed agency is to protect producers of identified goods in their intangible property rights and good will, restrain price cutting, and also to curtail the unlimited power which manufacturers would have if they would legally be allowed to fix and maintain resale prices without regulation.

The Commission stated in its report that both price maintenance and price cutting under certain conditions are unfair. Up to this time the Commission has followed the letter of the law and prevented price maintenance, but it urges Congress to establish the agency, since price maintenance in some cases is justified, while wholesale price cutting is unfair in many instances and affords no protection to the producer. Following is the complete report made by the Federal Trade Commission to Congress:

The question is, whether or not a manufacturer of standard articles, identified either by trade-mark or trade practice, should be permitted to fix by contract, express or implied, the price at which the purchaser can resell them.

The question has been continuously before the Commission since its creation. It has been the subject of study, investigation and hearing and constantly recurs, in various forms, in complaints filed with the Commission by business concerns.

The Supreme Court has made it clear that, in the present state of the law, the maintenance of a resale price by the producer is a restraint of trade and is unlawful.

Such being the judgment of the Supreme Court, the Federal Trade Commission has enforced the law, even though it may have appeared to operate inequitably in some cases. In its enforcement of this rule, the Commission has been mindful that the cutting of a recognized resale price on well established and identified articles has been, at times, indulged in for unfair trade purposes. When so unfairly used, such price cutting is attempted to be cloaked as lawful competition and justified by the Supreme Court decisions.

Thus, both price maintenance, and price cutting under certain conditions are found to be unfair and business men are perplexed. It is with the desire that this perplexity may be terminated that the Commission addresses the Congress.

It is urged, and, the Commission believes, with reason, that it would be unwise to vest with the manufacturers of articles the right, without check or review, both to fix and to compel the maintenance of resale prices.

It is true that business practice inclines producers to fix the lowest possible retail price in order to secure the greatest possible sale of their product, but in the complex commercial organism functioning between the production of an article and its final sale, for actual consumption, both the wholesale and retail merchants are entitled to just compensation for useful service performed.

It is similarly urged that manufacturers should be protected in their good will created by years of fair dealing and of sustained quality of merchandise.

The consuming public does not enjoy benefits by unfair price cutting to compensate it for the injuries following demoralization caused by price cutting. This for the reason that, in the long run, unrestrained price cutting tends to impair, if not to destroy, the production and distribution of articles desirable to the public.

There must be a common ground wherein the rights of producer, purveyor and consumer may each be fully secured and equity done to all. The search for such a ground has been a task of the Commission and results in the following conclusions:

(1) That producers of identified goods should be protected in their intangible property right or good-will.

(2) That the unlimited power both to fix and to enforce and maintain a resale price may not be made lawful with safety.

(3) That unrestrained price cutting is not in the public interest.

Bills now pending before Congress may well be made to meet the difficulties of the situation if amended to provide for a review of the terms of resale contracts and a revision of resale prices, by a disinterested agency.

Therefore, it is recommended that it be provided by law that if the manufacturer of an article produced and sold under competitive conditions, desires to fix and maintain resale prices, he shall file with an agency designated by the Congress, a description of such article, the contract of sale and the price schedule which he proposes to maintain, and that the agency designated by the Congress be charged with the duty, either upon its own initiative or upon complaint of any dealer or consumer or other party in interest, to review the terms of such contract and to revise such prices and that any data and information needful for a determination be made available to such agency.

Such legislation would seem to be in accord with the spirit of the times in that it is designed, by removing this perplexity, to promote the efficiency of manufacturing and commercial institutions and so to serve the interest of the consuming public.

### Want \$8,000,000 for Mail Trucks

WASHINGTON, Dec. 6—Assistant Postmaster General James I. Blakslee yesterday asked the House Postoffice Committee for an appropriation of \$8,000,000 to carry on and extend the use of motor trucks in the mail service. The appropriation is asked for the year beginning July 1, 1919. This does not include purchase of trucks, as these will be turned over by the army without charge.

The rural parcel post made up of a fleet of thousands of trucks can lower the cost of farm produce by elimination of a large part of the cost of handling, Blakslee said. He illustrated this by showing that it costs 80 cents a ton mile to take goods from New York piers to the consumer, which is in many cases more than the original cost of the goods plus the ocean freight rate.

### Restrictions on Iron Ore Imports Modified

WASHINGTON, Dec. 7—Restrictions previously placed on the importation of iron ore by ocean shipments has been modified to allow the importation of calcined spathic iron ore originating in and coming from England when shipped as back-haul cargo.

## Dutch East Indies Offer Market

### Far Eastern Division of Bureau of Commerce Points Out Opportunities

WASHINGTON, Dec. 6—The Dutch East Indies is recommended as an excellent market for American merchandise, and particularly automobiles, accessories and farm tractors, by the Far Eastern Division, Bureau of Foreign and Domestic Commerce, which states that there is a steady growth of American trade in the Indian markets. The import trade of the Island of Java, which contains 80 per cent of the population of the Dutch East Indies, expressed in guilders (equal to \$0.402) for 1916 and 1917 included the following:

	1916	1917	Inc. in 1917
Automobiles and parts .....	5,600,000	8,200,000	2,600,000
Machinery, utensils and electrical apparatus .....	2,200,000	5,000,000	2,800,000
Tires, automobile and bicycle .....	750,000	1,300,000	550,000
Lubricating (mineral) oil .....	900,000	900,000	.....

The exports from Java to the United States in 1916 totaled 68,500,000 guilders as compared with 140,800,000 in 1917, an increase of 73,300,000. The trade was principally in rubber, tin, hides and spices, and was very profitable for the natives, which in turn resulted in the large imports of machinery, automobiles, and iron and steel products.

Territory of local agents in the Dutch East Indies should not be limited too narrowly, says the report. However, an agent making headquarters in Batavia is 2 days by rail from Surabaya and 3 days from Banyuwangu. Menado, the center of the Moluccas, is a 2-week steamer trip, and a trip around the Celebes requires 27 days.

For one agent to work the whole archipelago periodically would not only require his full time but prove exceedingly expensive. A branch office or district agency, therefore, in Batavia with authority over the whole colonial market would seem a practical solution. Such an office could establish sub-branches at all the principal centers, and in so doing take initial orders. It would subsequently collect and handle in a lump order from Batavia all outlying orders, at a great saving in cable charges, and the goods could be shipped direct to such branches and financed through its bank at Batavia, the branch distributing the shipment to its sub-agents.

Such a district agency would also save expense and time by acting as a clearing house for market reports from the manufacturer to the sub-agencies and could thereby answer every inquiry as to prices in short order from the latest information at its command. The advantages and economies of such a plan are particularly pertinent factors in successful marketing in this locality.

# Aerial and Motor Truck Mail Service Development

## Postmaster Burleson Indicates Enormous Expansion Within the Next Year in Report to President—Air Mail to Cuba and South America Forecasted

WASHINGTON, Dec. 6.—That aerial mail, city motor vehicle, and parcel-post motor truck will be developed amazingly within the next year is the most important message in the annual report made by Postmaster General Burleson to President Wilson this week.

The report, which contains a complete summary of the work performed in the new air mail service, the parcel-post truck service, and the city motor vehicle service, forecasts extension of the aerial mail service between New York and San Francisco, Boston and Key West, Key West and Havana, Cuba, Cuba and Panama, and Key West via the West Indies to South America.

The Washington to Philadelphia route, it is stated, has performed as a working laboratory, and the experiences secured will insure perfection of the service in the contemplated territories. A 9-hour schedule will be maintained between Chicago and New York, as compared with the 21-hour railroad schedule, and similar time savings will be effected on all of the routes planned. Following is the report in full of the aerial mail service:

During the year there was created a new rapid medium of mail transportation through use of airplanes. This subject had been given considerable study and a number of spasmodic flights with mail had been undertaken by exhibition aviators, but it was not until the establishment of a regular and dependable aerial mail service between Washington and New York that transportation of mail by airplane became a permanent and practical feature of the Postal Service.

The aerial mail route between Washington and New York was inaugurated on May 15, 1918. One round trip daily except Sunday is being made without fail. The trip from Washington to New York is performed on an average of 2 hr. and 30 min., and from New York to Washington in 2 hr. and 50 min., the difference in time being due to the resistance offered by the prevailing winds, which are usually from a westerly direction. A stop for the exchange of mail on each trip is made at Philadelphia. An average of 7½ tons of letter mail is being carried each month.

The cost of the operation of the service since it began, including development of new routes, is at the rate of \$108,223.41 per year, or 79 cents per mile operated. The cost per ton-mile of mail carried is \$5.35. By this service mail between New York and Washington is advanced from 2½ to 3 hours over the train service.

In addition to the airplane mail carried there is dispatched daily from Washington to New York letter mail from southern connections made up to carrier districts in New York City, which mail is thereby delivered to all parts of New York the same afternoon instead of the following morning.

The Aerial Mail Service was inaugurated with the co-operation of the War Department, which furnished the machines and aviators and conducted the flying and maintenance operations. This co-operation, which was of

inestimable value, was maintained until Aug. 12, when the entire operation was taken over by the Post Office Department and the work performed by this department with its own equipment and personnel.

The task which the Army had undertaken was new and full of unsolved problems. A few flights in the beginning were defaulted, partially abandoned, or interrupted by stormy weather, but gradually the service settled down to an absolutely dependable one. It gives pleasure to report that the high standard of daily perfect flights which the Army succeeded gradually in establishing is being maintained by the Post Office Department regardless of weather conditions.

The following table summarizes the first four and a half months' operation of this service:

Month	Miles flown	Pounds of mail	Cost of service	Cost net mile	Cost per ton-mile	P.C. of form-ance	Forced land-ings	Time in air Hr. Min.	Average speed Miles
May (15 days) ..	5,324	4,749	\$3,632.11	\$0.69	\$8.15	76.78	4	78 16	68.02
June .....	10,640	13,031	9,922.71	.93	7.12	93.00	8	151 22	70.29
July .....	11,720	16,967	10,001.46	.89	5.43	92.59	8	156 34	74.86
August .....	11,894	16,558	9,555.67	.80	5.24	99.07	3	159 24	74.61
September .....	11,753	15,206	7,421.83	.63	4.01	100.00	3	156 9	72.69
Total .....	51,331	66,555	40,583.78	.80			28	701 45	72.57
Aver. per month.	11,407	14,790	9,018.61	.79	5.25	92.28	57/9	155 57	72.56

The foregoing is the cost of operating the New York-Washington route. To ascertain the total cost of the Aerial Mail Service add \$2,216.91, the cost of preliminary work on the New York-Chicago route to be inaugurated this winter. The marked reduction in cost of the New York-Washington route for September was due to temporary withdrawal of operatives in connection with establishment of the New York-Chicago route.

The Washington-New York route has served as a working laboratory in which the many unknown factors that enter into the maintenance of a daily aerial service are being successfully solved, and the Post Office Department only awaits the day when the aircraft production of this country can more than supply the needs of our own Army and those of our allies to make effective the program for the aerial mail that I have directed to be put into operation as speedily as war conditions will permit.

This program directs, first, the establishment of an aerial mail service connecting the principal commercial centers of the country by a system of trunk lines and feeders, and, secondly, connecting this country with the West Indies and Central and South America. The trunk lines and feeders decided upon under this program are:

1. New York to San Francisco, with feeders from:

- (a) Chicago to St. Louis and Kansas City.
  - (b) Chicago to St. Paul and Minneapolis.
  - (c) Cleveland to Pittsburgh.
2. Boston to Key West, with feeders from:
- (a) Philadelphia to Pittsburgh.
  - (b) Washington to Cincinnati.
  - (c) Atlanta to New Orleans.

3. Key West, via Havana, to Panama.

4. Key West, via the West Indies, to South America.

In this program I have to report progress as follows:

1. Boston to Key West.—Of this route the Washington-New York division has been operated since May 15 and is functioning perfectly.

The Boston-New York division has been tentatively laid out and will be established whenever, in the opinion of the War Department, its operation will not conflict with the war needs of the country.

The Washington-Atlanta and Atlanta-Key West routes are now being worked out with a view to their immediate establishment at the close of the war.

2. New York to San Francisco.—Of this route the division from New York to Chicago has been carefully worked out. The War Department, under act of Congress of July 1, 1918, has released to the Post Office Department, for the use of this division, airplanes of 650 lb. mail-carrying capacity which are no longer suitable for war needs. The hangars have been ordered, landing fields obtained, and the route has been ordered established before the close of the present year.

In a series of airplane flights by the Post Office Department early in September the route was carefully charted for emergency and regular landing fields. In this work one

airplane made a record flight from Chicago to New York in less than 14 hr., including all stops on route. The flights were made through storm and heavy rains over parts of the route.

The reconnaissance developed that it will be feasible to maintain a daily 9-hr. schedule between New York and Chicago, as compared with the 21-hr. schedule of the Twentieth Century Limited. The New York-Chicago schedule for the present will call for departing from New York at 6 a. m. and arriving at Chicago about 3 p. m., thus connecting with all city deliveries. The principal mail stop will be Cleveland.

The time between Chicago and Cleveland will be cut to 3 hr. 45 min., and between New York and Cleveland to 5 hr. and 15 min. Mail from the Atlantic seaboard will be advanced from 12 to 24 hr. to the West and Southwest by this new service. The feeder routes from Chicago to St. Louis, Kansas City, St. Paul, Minneapolis and the remainder of the trunk line from Chicago to San Francisco will be worked out during the ensuing year with a view to their immediate inauguration at the close of the war.

3. Key West to Panama, and

4. Key West to the West Indies and South America.—Negotiations looking to the conclusion of special aerial mail conventions between the United States and the foreign countries involved for the establishment of these routes to the West Indies and Central and South America are now in progress. It is realized that these overseas routes will require the most powerful airplanes with wireless installation and special construction to make them safe over the seas, but the enormous commercial advantage that will result by materially reducing the time between this country and Central and South America will justify

tify the expenditure that such a service will entail.

In the conduct of the service now in operation and the preliminary work on the routes to be established immediately upon the termination of the war, the Post Office Department is receiving whole-hearted support from the War Department, Navy Department, National Aeronautical Advisory Board, Bureau of Standards, Weather Bureau and Geodetic Survey, besides much local assistance from committees, individuals and aero clubs in this country.

Postal receipts from eight parcel post motor truck routes operated from Jan. 1, 1918, to June 30, 1918, totalled \$204,198.89, an average of more than \$25,524.71 per route, with a total annual earning rate of \$51,049.59 per route, according to the report on the parcel post motor truck service. These earnings, it is pointed out, were exclusive of the important benefits such as the increased production and distribution of food, the elimination of intermediate cost of handling between producers and consumers, and the facilitation of the collection and forwarding of produce and merchandise. There are 150,000 miles of important highways now available, states the report, for truck line routes, and it is expected that thousands of military trucks will be used over these routes, which average 50 miles each and provide use for 80,000 trucks.

Following is the complete report on the parcel post service:

After the receipt of proposals that were considered exorbitant or unreasonable during the period, Dec. 1, 1917, to June 30, 1918, eight motor vehicle star routes were established between important market centers as government-owned vehicle routes and the cost of their operation was paid from the appropriation for the inland transportation of the mails by star routes.

These routes are designed primarily to promote the conservation of food products and to facilitate the collecting and forwarding of produce and merchandise, as well as any other matter admissible to the mails as parcel post, thereby affording a means of bringing the producer into immediate touch with the consumer, and eliminating intermediate cost of handling, thereby reducing cost to the ultimate consumer by making more accessible the productive zone in the vicinity of large cities.

By the use of such conveyances one man can perform as much service in a day as four average producers could under former methods, thus meeting to an extent loss occasioned by many farmer-producers who were diverted to occupations incident to the prosecution of the war.

During the six-month period, Jan. 1, 1918, to June 30, 1918, the postal receipts from these eight routes were \$204,198.89, an average of \$25,524.71 per route; a total annual rate of earning of \$408,396.78, or an average annual rate of earning per route of \$51,049.59. The total expenses were \$41,110.08, an average cost per route for the period of \$5,138.76, and an average cost per route of \$10,277.52. The average net profit per route for the period was \$20,886.04, an average annual rate of profit per route of \$40,772.08. The average earning per mile of travel was \$0.1568 and the average profit per mile of travel was \$0.6232.

The act making appropriation for Postal Service for the fiscal year ending June 30, 1919, having provided a specific appropriation with which to conduct experiments in the operation of motor vehicle truck routes, the expenses of operating the eight existing routes previously operated under the appropriation for the inland transportation of the mails by star routes is now paid from the specific appropriation.

While a portion of the revenues derived from mail matter carried on these routes, particularly transit mail, should properly be credited to other branches of the service, yet due to the fact that a quicker dispatch and more direct and expeditious delivery can be effected, patrons are expressing a preference for this service in forwarding mail matter of all classes; hence a considerable portion of the revenues should properly be credited to the motor vehicle mail service.

Owing to the experimental nature of the motor vehicle truck service, it was deemed best to await the stabilization of the service before discontinuing other existing mail routes or mediums of supplying mail which it could supplant; hence the economies effected in this direction are not as great as they otherwise would have been.

However, during the period, Dec. 1, 1917, to June 30, 1918, an annual saving has been effected of \$4,478.12 by the discontinuance of star railway mail service, mail messenger and electric car service, which it has superseded.

A total number of 105 trucks is required to serve the patrons of routes already established.

A standardized truck has been adopted for use on these routes, which is also adapted for use in all mail branches of the Postal Service, and four of these trucks have been constructed and are ready for delivery.

As provided in section 8 of the current appropriation act, the War Department has turned over to this department the chassis of two Army trucks, type AA, and they are now in service. A further extension of this service will provide use for a large number of vehicles when no longer necessary for military purposes, and other chassis will be supplied by the War Department, no doubt, from time to time.

An essential feature of this service is the commercial convenience of all the patrons, supplying them with data and information concerning points where they can secure the best products and commodities at the least cost. Postmasters at offices on the routes are reporting to the department each week the local retail prices received by farmers and producers for their commodities. These data are compiled and disseminated through the public press weekly.

In the light of this experience, it is proposed to establish through or trunk-line routes of an approximate length of 50 miles each—to connect one with the other—extending out from the larger consuming centers, through productive territory contiguous to such centers and removed from direct established lines of transportation, and to then connect with the trunk-line routes lateral or

feeder routes. There are, approximately, 150,000 miles of improved highways now available for trunk-line routes, and several thousand localities in which lateral or feeder routes in productive territory can be operated throughout the year.

There is an insistent demand for increased food production and a necessity for a more reliable means of intercommunication for the transportation of commodities, particularly food of local origin or production, and merchandise and implements incidental to food production.

The commercial and economic advantages of this service are so evident that its extension would seem to be desirable.

The efficiency of government-owned motor vehicle service in the cities over the contract method, states the report, has been demonstrated many times in the recent experiments made by the government. The service in operation in Boston, Brooklyn, Buffalo, Chicago and many other cities, controlling a total of 1004 trucks, ranging from  $\frac{1}{2}$ -ton to  $3\frac{1}{2}$ -ton, has been both efficient and profitable. The efficiency of the service has been so remarkable, says the report, that even express companies transport packages between two points by the local parcel post motor vehicle mail service for the ultimate delivery of the expressed parcels.

This service, which has been extended gradually, states the report, is operated in Boston, Brooklyn, Buffalo, Chicago, Detroit, Indianapolis, Nashville, New York, Philadelphia, Pittsburgh, St. Louis and Washington. It employs 1200 mechanics, chauffeurs, garagemen and clerks.

It has been instrumental in creating a coalition of all of the work of the Postal Service, making a directly connected collection, distribution and transportation system which was not possible under the old contract system.

The contract system in the larger cities also developed a constant friction between the contractor and the local postal officials which is now completely eliminated and which has been replaced by harmony and co-operation. It should be understood, says the report, that the charge against the appropriations for vehicle service for the fiscal year during which the service is installed in any office is usually in excess of the amount saved, due to the fact that the entire purchase cost of the fleet of trucks is charged against the current appropriation and the full economies cannot be secured until after four years of operation. Furthermore, many of the economies, adds the report, cannot affect other appropriations which under the law cannot be called upon for re-imbursement.

#### May Drop Return Loads Plan

BOSTON, Dec. 7—With the practical dissolution of the Massachusetts Committee of Public Safety, which was to have contributed \$2,000 toward the establishment of a fund to put into operation a Return Loads Bureau, it looks now as if that scheme was dead as far as the Bay State was concerned. The motor truck dealers made an investigation and recommended that a bureau be established and \$1,000 was pledged to aid the work. The Boston Chamber of Commerce also investigated the matter thoroughly and reported favorably and planned an appropriation of a similar amount, and to have headquarters in its buildings. The Massachusetts Committee on Public Safety felt that it was a necessity, too, and its officials were willing to contribute

\$2,000. The details were being worked out by a committee on transportation at the Chamber of Commerce. Now without the support of the state funds, which will not be available unless the Governor and his council authorize such an expenditure, the future looks dubious.

#### Milwaukee Show Jan. 24-30

MILWAUKEE, Dec. 9—The dates of Jan. 24 to 30 have been selected by the Milwaukee Automobile Dealers, Inc., for the eleventh annual Milwaukee show, to be held in the Auditorium. At a special meeting of the association, following the return of Manager Bart J. Ruddle from the conference of show managers in Cleveland, the action taken shortly after hostilities ceased to proceed with 1919 show was ratified and cor

## Reo Annual Report Very Satisfactory

Total Assets Show Increase of Over \$1,300,000 as Compared With Last Year

DETROIT, Dec. 5—The annual statement of the Reo Motor Car Co. for the fiscal year ending Aug. 31 shows a surplus of \$5,494,828, as compared with \$4,245,915 for 1917. The total assets show an increase of over \$1,300,000, as compared with 1917, while the current assets compare with \$8,836,922 for last year, an increase of over \$1,500,000. Considering the general conditions and the great reduction in the production of normal products, the balance of the company is considered most satisfactory.

### More Oil from Texas

AUSTIN, Dec. 8—An enormous increase in oil refining facilities in Texas will be provided within the next few months. This is assured by the many new projects of this character which have already been decided upon. It is interesting to note that practically all of the new refineries now under construction or in early prospect in the Central West Texas fields belong to the smaller independent oil producers. The larger operators are financially able to lay pipe lines and the site of their refineries are for the most part some distance away from the producing fields.

The product of the Central West Texas fields is of a much higher grade than that of the fields of the Gulf coast region and this accounts for the remarkable strides that are being made in constructing refineries for handling the more valuable

oil. Instead of locating their refineries in the producing territory, the larger companies are arranging to pipe the product to Fort Worth, Dallas, Houston and Galveston, where it will be put through the refining process. More than a dozen new small refineries are to be built by independent operators at various points in the Central West Texas fields within the next few months.

### Texas Has 250,201 Vehicles

AUSTIN, Dec. 8—It is shown by the records of the State Highway Commission that a total of 250,201 motor vehicle licenses were issued in Texas up to Dec. 1, 1918. Of this number 3250 were for motorcycles. There are a total of 4188 motor vehicle dealers in the state.

### Starters for Lauson Tractors

NEW HOLSTEIN, WIS., Dec. 8—The John Lauson Mfg. Co. has placed a contract with the Christensen Engineering Co., Milwaukee, for Christensen starters with which all Lauson farm tractors will hereafter be regularly equipped. The Christensen starter differs from other starting devices heretofore put on the market in utilizing the "carburetion principle" instead of electric or air systems. The Lauson is the first farm tractor, so far as known, to be regularly equipped and sold with other than an electric starter.

### More Money for Auto Body

LANSING, Dec. 9—Stockholders of the Auto Body Co. have authorized \$600,000 of new preferred stock, of which \$500,000 will be issued at once. This will be 6 per cent cumulative.

### Cultivating Japanese Automotive Field

(Continued from page 1012)

tariff automobile parts pay a duty of 25 per cent ad valorem, whereas the general rate on such parts is 30 per cent ad valorem.

The listing of vehicles is clear and there is rarely any conflict on interpretations, although there was some time ago an importation of tractors which was passed as farm machinery at a reduced rate of duty. This classification was confirmed after the matter had been contested in court. The Japanese word covering all motor propelled vehicles is "jidodsha," meaning literally "self-propelled vehicle," and it was on this construction that the case was contested and lost by the customs authorities. Attention has also been called to a case wherein chassis were admitted as parts, in view of the fact that they were not fitted with bodies, but it is doubtful if this interpretation will be upheld.

Advertising matter may be packed in shipping cases with automobiles, and if in black and white will be admitted without duty, but if lithographed in colors is subject to duty. Pictures are also dutiable. Advertising matter shipped separately is governed by the same restrictions.

## Definite Program for Snow Removal

Highways Transport Committee Asks Co-operation from Various State Committees

WASHINGTON, Dec. 7—The Highways Transport Committee in forming a definite program for snow removal this winter from the various highways has addressed the different State Council of Defense Transport Committees asking them to give immediate attention to the following subjects:

Of the powers of the State Highway Department or Commission for removing snow. If such powers are not specifically covered by statutes whether maintenance funds can be used in an emergency?

What co-operation and work can and will be undertaken by the counties and States?

What co-operation and work can and will be undertaken by the municipalities and State?

What preliminary measures can be undertaken which will prevent the drifting of snow, such as location and erection of snow fences? Also, the change of rail, board, picket and hedge fences which check the currents of air during a snow storm, thus causing drifts to form, and removal of brush or weeds paralleling the road, which invariably cause drifts to form.

### Highway Department's Attention Called

Attention by State Highways Department or Commission, through its field organization and in co-operation with the State Highways Transport Committee, of physical conditions along the highways tending to cause drifts. Recommendations as to the best means of dealing with same by preventive methods.

The making of snow removal reports of every snow storm on such highways as are designated to be kept free from obstruction by snow so as to allow continuous essential highways transportation.

Letters have been sent to the Transport Committees in Massachusetts, Maine, Vermont, New Hampshire, Rhode Island, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, Ohio, Indiana, Kentucky, Michigan, Illinois, Wisconsin, Minnesota, Iowa, Missouri, Kansas, Nebraska, South Dakota, North Dakota, Colorado, Wyoming, Montana, Idaho, Washington, Oregon, California and Nevada.

### Continuous Truck Movement Needed

The Highways Transport Committee realizes that there will be great need for continuous motor truck movement this winter to assist in the distribution of foodstuffs from farm to mill and mill to seaboard or farms to seaboard, and consequently has asked the regional, State, district and county organizations to leave no stone unturned in facilitating this work.

## Following Directions

**A**RE you one of the motorists who last winter used an anti-freeze compound in a manner which the maker of the preparation never specified and then condemned the stuff as being no good? If you did such a thing, you had better make sure that you followed directions to the letter. The manufacturers of anti-freeze compounds have met car and truck owners more than half way, and the complete directions printed on every label of their products are put there for but one purpose, and that is, to make sure the preparation will be used correctly.

\*\*\*

**O**BVIOUSLY if the motorist does not do his part and merely dumps the stuff in his radiator, without following directions, he does wrong and one morning he will go to his unheated garage only to find the tubes of his radiator burst or the waterjacket cracked. The next thing he does is blame the anti-freeze substance, whereas, had he been careful to follow instructions he could have gone all winter without worrying about the cooling system.

**M**OST of the anti-freeze preparations have been put up in convenient form, but the amount of water in the cooling system together with the variation in temperature dictate to a considerable extent how the preparations must be used. All this is set forth in the maker's directions and in every case the big thing to watch is that the radiator has no leaks and that the hose couplings are in good shape. In fact, new hose is desirable before adding the anti-freeze, as after a season's use the inner layers become separated.

\*\*\*

**T**HE radiator should be washed out carefully with a solution of hot soda, which reveals any leaks that exist. These then should be soldered. Many anti-freeze substances attack dirt and sediment and if your radiator started to leak last winter after you added the anti-freeze, it was because you failed to clean the radiator and repair the leaks. The anti-freeze told you that leaks existed. You probably thought the anti-freeze was eating away the metal. Follow the maker's directions this winter and you will play safe.

*Read Our Guarantee on*

**JOHNSON'S**

**FREEZE-PROOF**

**We guarantee that Johnson's Freeze-Proof has no more effect than water on the metals of the radiator or on rubber.**

**If Johnson's Freeze-Proof is used according to the simple directions in the proportion shown on our scale, it will absolutely protect your radiator against damage from freezing.**

**We do not guarantee Johnson's Freeze-Proof when used in cars with aluminum manifolds, although it has been used satisfactorily in hundreds of such cars. Water alone often has an injurious effect on aluminum.**

**\$1.50 Protects a Ford**

One package of Johnson's Freeze-Proof (Cost \$1.50) will protect a Ford to 5° below zero, and two packages to 50° below zero. For larger radiators or to protect to a lower temperature, use additional Freeze-Proof according to the scale on the package.

## Development of the Aircraft Spruce Industry

**Spruce Most Suitable Lumber for Wing Spars and Struts—Army Furnished Volunteer Lumbermen—Loyal Legion of Loggers Formed to Combat I. W. W. Activities**

By Lawrence K. Hodges

**I**N August, 1917, shipments of spruce suitable for airplane construction amounted to 202,264 ft. There were no mills equipped to cut with the grain and in the two states of Oregon and Washington there were only 25 spruce mills all told.

Yet, in the following April, the output of spruce for plane construction had been pushed up to 30,000,000 ft. a month and since then even this figure has been exceeded.

This seemingly impossible result has been achieved in a manner which makes one of the brightest pages in the history of the world war.

In December, 1917, Brigadier-General Brice P. Disque realized that radical steps were necessary to keep pace with the demands of the United States and the Allies for spruce. He called a conference of five experienced mill owners and asked them if it were possible to design and build a mill which would cut spruce the right way and eliminate waste.

Four of the five said it could not be done. The fifth, H. S. Mitchell, thought it could be done. General Disque told him to go ahead. In two weeks work was started on the mill, and in 45 working days, despite the interference of the rainy season, the mill was complete and working. It is one of the largest mills on the Pacific Coast, employs 1800 men and works continuously in three eight-hour shifts.

The story of airplane spruce tells of the growth of a mere by-product of the North Pacific Coast lumber industry into a place of the first rank within one year.

Before the war Sitka spruce was cut as an incident to the logging and manufacture of Douglas fir, among which it grows in clumps, chiefly on the west slope of the coast range of mountains facing the Pacific Ocean. At that time there were in Oregon and Washington only twenty-five spruce mills, and any mill was so called of which twenty-five per cent of the cut was spruce. The lumber was used in building and in making boxes and food containers.

At the outbreak of the war the Allies scoured the world for lumber that was specially fitted for the wingbeams and struts

of airplanes, and they soon discovered the merits of Sitka spruce. They began to buy lavishly, but the output was limited.

Douglas fir is the predominant timber of the Pacific Northwest and the stand of spruce is so scattered that it was not commercially practicable to cut roads into remote forests in order to reach it. Only straight-grained stock could be used, and this must be free from cross grain, twisted grain, knots or pitch.

There were no mills equipped to cut with the grain, and consequently nine-tenths of the spruce bought by the Allies was waste, though they paid as much as \$250 a thousand feet for it. Yet so anxious were they to obtain it that soon after the United States declared war the British, French and Italian armies each sent an officer to the Pacific Coast to appeal to the people to get out more spruce, and the United States Government seconded their efforts.

The lumber industry of the two states was in no condition to respond to such an appeal, though good will existed without measure. The manufacturers were just emerging from a long period of depression, and many of them were not firm on their financial feet.

### Obstructive Measures Inaugurated by I. W. W.

The demand for lumber for army cantonments no sooner begun than the Industrial Workers of the World, which was active throughout the lumber region, declared a strike, ostensibly for the 8-hr. day and many other things, but actually to make war on what it called "capitalism" and to obstruct war on Germany. Acts of sabotage, by which saws, machinery and food were destroyed and some mills were burned, were frequent.

The War Department attacked the difficulty by sending Colonel, now Brigadier-General, Brice P. Disque to the Coast in October, 1917, to make a preliminary survey of the situation. He was selected because of the ability which he had displayed

while in the Philippines in overcoming obstacles and in inspiring men with zeal, and later as warden of the Michigan penitentiary. He returned about the middle of November with full authority to do whatever was necessary to get out the spruce.

He applied himself first to establishment of harmony between the employers and workmen. Starting with the belief that the lumberworkers were loyal at heart and that not 5 per cent of them were convinced adherents of the I. W. W., he seized upon a suggestion which had been afloat among the manufacturers and which had been commended in the *Portland Oregonian*, that a new organization be formed among the workers bound together by the spirit of patriotism to combat the I. W. W.

Probably if the movement had been initiated by the employers, distrust among the workers would have made it a failure, but when taken up by the army it proved an amazing success.

General Disque sent officers throughout the lumber regions to organize in every logging camp and sawmill a local branch of the Loyal Legion of Loggers and Lumbermen. He called for 10,000 volunteers from the army to cut spruce and they came from camps as distant as the Mexican border.

He sent these men into the woods, not only to cut spruce but to instill patriotism, or to awaken that sentiment where it was dormant. In a few months the new organization had gained control in every camp and town west of the Cascade Mountains, the I. W. W. had been put to rout and the manufacturers were so well pleased with the result that they placed the settlement of all questions of wages, hours, working and living conditions in General Disque's hands, agreeing to act upon any decision he made.

He established the 8-hr. day, raised wages, but fixed a maximum to discourage manufacturers from stealing each other's men, ordered that camps and boarding houses be supplied with good board, beds, baths and be cleaned up and kept clean, and fixed uniform rates for bed and board. His orders were cheerfully obeyed, and all went to work with good will and good feeling.

So impressed were the lumbermen of the white pine belt between the Cascade and Rocky Mountains with the success of this unique organization that they requested General Disque to extend it to their field. It was received there with as much favor as farther west, and the General was made sole

*Brigadier-General Brice P. Disque,  
commander Spruce Production  
Division*

arbiter in all labor questions and harmony extends through both regions.

With the co-operation of the employers the Loyal Legion now holds sway in Western Montana, Northern Idaho, and all of Washington and Oregon and has 120,000 members. The capstone was put on the structure last June when an agreement was reached to continue the organization after the war and to establish joint councils of employers and employees, local and general, for adjustment of disputes, with General Disque or his successor as sole arbitrator.

While he was getting this settlement of the labor question under way, General Disque set about increasing the output of spruce in other ways. The middle of November is the worst season of the year for logging operations on the North Pacific Coast, for it is the wet season, when rain is frequent, streams are in flood and the ground is soft and mushy; but war could not wait for good weather.

Contracts were made for purchase of spruce timber wherever it could be found in sufficient quantity and was accessible by building any kind of a road for a reasonable distance. Homesteaders were paid

to cut the spruce on their claims, to rive it with wedges into cants and to haul it through the woods to the nearest railroad or highway.

But this was a temporary expedient, to be followed only until operations could be extended on a larger commercial scale. The spruce on big timber tracts was purchased and contracts were made with logging and general contracting companies to cut it and to build roads.

Financial aid was given these companies in purchase of logging equipment, rails, cars and locomotives, motor trucks and tractors, and priority was obtained for manufacture and shipment of all this material.

The troops under General Disque's command, who now number 30,000, were organized as the Spruce Production Division, and headquarters were opened in Portland, Ore., occupying an entire floor of a big business block, where hundreds of men in khaki handle one of the biggest businesses in the United States. The field of operations extends all the way from the Canadian boundary and the Straits of Fuca on the north to the southern line of Oregon, a stretch of over 600 miles.

The Sitka spruce is a shy, retiring tree, though it grows to a height of over 150 ft. to the first limb and to a girth of 11 ft., and is found deep in forests of fir.

To reach the heart of the timber the Government has built 166 miles of main railroad and 103 miles of spur track. From these lines graveled, plank or corduroy roads branch into small canyons and ravines, and over them motor trucks haul logs to the railroads, long trains of trucks often being seen.

Building these roads was no light task, for the country is rough and covered with dense timber and underbrush, and clearing alone often costs \$10,000 a mile. Some stretches have been built on the sides of slippery soapstone hills, others on huge tree trunks laid in parallel lines with the ties notched into them, others on piles over deep swamps and others on trestles 90 ft. high spanning gulches.

On the South Alsea Railroad a bridge 8800 ft. long containing 6000 piles has been built across Alsea

*Loyal Legion at attention*

Bay, Ore., by soldiers and a few civilians. A bridge of poles 196 ft. high was built across the Skagit River, Wash., and is declared to be the highest single pole bridge in the world. Eighteen thousand soldiers have been employed in this work, including some engineers who earned \$7,500 a year in civil life.

It became evident that a radical change in the methods of cutting airplane stock must be effected in order to meet the enormous demands of the United States and the Allies and at the same time to reduce the waste in shipment of stock which was rejected at the airplane factory.

Ninety per cent of the stock shipped to the Allies was thus rejected, and the waste was not confined to the lumber itself but extended to freight charges and to use of transportation facilities at a time when a famine of cars and engines had caused a fuel famine east of the Mississippi River.

Economy of the timber itself was an important consideration, for, while the statistics of the stand of spruce on the Pacific Coast look imposing, by no means all is fit for use in aircraft and, if it were cut at the rate indicated by the war's requirements, the supply would be exhausted in comparatively few years.

#### Where Sitka Spruce Grows

Sitka spruce grows all along the coast from the southern line of Oregon through that State, Washington, British Columbia into Southeastern Alaska. The best is found in the two States named, the total being about 11,000,000,000 ft., of which about 4,000,000,000 ft. can be reached at reasonable cost. British Columbia has more than 18,000,000,000 ft., but it is of inferior quality and comparatively little of it is accessible. Alaska has from 15,000,000,000 to 18,000,000,000 ft., but this is not so good as that of British Columbia; only about 1,000,000,000 ft. is suitable for airplanes and little of that amount is accessible.

The Government was therefore compelled to draw its supply from the 4,000,000,000 ft. of accessible timber in Oregon and Washington. This limitation of the available quantity led General Disque to seek means of obtaining from it the largest possible proportion of good stock.

He found that there were in the two States only twenty-five so-called spruce mills, any mill of which 25 per cent of the cut was spruce being so designated, but that they cut the log longitudinally without regard to the grain and had not the rigid system of inspection requisite to rejection of imperfect stock. As the grain of many logs does not run straight, which is essential in wingbeams, and as knots, twisted grain and pitch occur, this method of cutting was the main cause of waste.

The solution of the problem seemed to be the construction of a mill specially designed to cut with the grain and, instead of shipping broad fitches of which a large part would be waste when it reached the factory two or three thousand miles distant, to carry the process still further by cutting the lumber approximately to wingbeam size, reject all defective stock at the point of production and ship only perfect stock.

With this end in view he called five experienced lumbermen

*Stand of Oregon spruce used for airplanes*

into conference at Portland on Dec. 1, 1917, stated his problem to them and asked whether construction of such a mill was practicable.

Four of the men were doubtful, but the fifth, who was H. S. Mitchell, owner of a large mill at Wauna on the Lower Co-

*General view of airplane spruce cut-up mill, Vancouver, Wash.*

*Living spruce cants by hand*

lumbia River, thought it could be done and made some practical suggestions.

On the following day General Disque asked Mr. Mitchell to design, build and operate a mill after his own idea, as he had had many years' experience of that kind before he became an operator. Mr. Mitchell remarked that he had a pretty big job on his hands at Wauna, but the General answered in substance:

"I have no hesitation about asking any man to drop any job, no matter how big, when the Government needs his help to win the war."

"What could I do when it was put up to me like that?" said Mr. Mitchell in relating the conversation. He dropped his job, reported for duty 3 days later and has been at it ever since, prepared to stay with Uncle Sam as long as he is needed.

#### Operations Proceeded Rapidly

From that day things moved quickly. Three days later lumber was ordered from 40 mills and machinery from manufacturers all the way from Portland to Cincinnati, all being shipped under priority orders. A broad stretch of level ground on the north bank of the Columbia river at Vancouver Barracks, 10 miles from Portland, was selected as the site. It was necessary to extend a spur track of the Spokane, Portland & Seattle Railroad a mile and a half, and L. C. Gilman, president of that road, was asked to lay it immediately. He said:

"I have not a foot of rail loose and do not know where I can find it, but I will get it."

He tore up some tracks in the Portland terminal yard and a week after the request was made the first carloads of lumber were delivered at the mill site. By Dec. 15 material was assembled, and work began on the foundations just 2 weeks after the project was broached to the lumbermen's committee. The rainy season was in full force, and work was suspended for a few days while the entire coast was scoured for rain clothes for the 250 men employed. Then, though rain and snow continued, construction stopped for nothing except Sundays and holidays until the mill was opened on Feb. 7, having been built in 45 working days.

The mill is one of the largest on the Pacific Coast and is the first of its kind, though others from the same design have been built by the Spruce Production Division at Toledo, Oregon, on Puget Sound, and by the British Government on the coast of British Columbia.

Trainloads of cants arrive at one side, are lifted by cranes to handcars which are pushed into the mill, and come out on the other side as perfect airplane stock to be loaded for shipment to Eastern factories. The mill is operated continuously by electric power, 1800 men being employed in three 8-hr. shifts. There are six units, the most original feature of which is a series of movable knees by which a flitch is aligned so that the saw cuts with the grain. Thus it often happens that the cut runs diagonally from end to end of a flitch. The cant or flitch passes through four operations in the process of conversion into airplane stock, and undergoes three inspections to eliminate any pieces which show defects.

Dry kilns with a capacity of 200,000 ft. a day reduce the weight of much stock 20 per cent, saving a substantial sum in freight and preparing stock for immediate use, while air drying would occupy several months.

With the exception of a few highly skilled civilians, all the employees of the mill are soldiers who volunteered for this service. Few of them had ever seen the inside of a sawmill, and it was necessary to train crews until there were enough to operate all the six units. Men are sent from this to the other Government mills, and to instruct the crews of commercial mills which work on spruce. The patriotic soldier spirit is apparent in the zeal and skill with which they work.

# Hair-Line Defects in Crankshafts

## Metallographic Study and Physical Tests of Chrome Nickel Steel Crankshafts to Determine Nature and Effect of So-Called "Hair-Line" Defects on Their Physical Strength

By Lieut. P. J. Piccirilli

ONE factor which is the cause of much skepticism as to the strength of chrome nickel steel crankshafts is the existence of so-called "hair-line" defects. These defects appear most prominently upon the surface of finished crankshafts as very fine lines, resembling incipient checks, but they are always found to be running parallel with the axis of the shaft itself. With inspectors to whom their nature is unknown they are the cause of probably 90 per cent of the shaft rejections, the shafts being declared unsafe due to the existence of incipient checks. Since these "hair-line" defects have been the cause for so many rejections of shafts, the writer arranged a series of very accurate tests on two engine crankshafts which contained the above-mentioned defects.

In order to determine the effects of the "hair-lines," both physical and metallurgical tests were made. The tests described here were carried out at the Laboratories of Columbia University, New York, and in connection with the physical tests described it is interesting to note the method employed to measure the torque strain which permits of reading to one hundred thousandths of an inch (0.00001).

### Description of Physical Tests

In order to carry out the tests in such a manner as to avoid conflicting results, two motor shafts in which "hair-line" defects existed were chosen. One of these shafts, which for the sake of convenience we shall call shaft A, was subjected to torsional moments to determine the effect of torsion upon the defective bearings, and upon the shaft as a whole. The defective bearings previously cut from shaft A, after the latter had been subjected to torsional strain beyond the elastic limit, were compressed laterally, and the effects upon the "hair-line" defects were noted. In order not to obtain confusing results, a second shaft, which we shall call shaft B, was taken, and the physical properties of the material in direct tension were ascertained from specimens secured from it. Shaft B was used for this purpose rather than shaft A because the latter already had been

subjected to test. Therefore, in order to obviate the registration of any strains or stresses which had already been started in shaft A, the test specimens for determining the physical properties were taken from shaft B.

### Torsion Test

In order to investigate the effect of torsional stresses upon the defective bearings of shaft A, which contained three such defective bearings, located as shown in Fig. 1, it was subjected to torsion in a Riehle torsion machine. In addition to a careful examination of the defects under torsion, complete data were obtained for plotting a "load

Fig. 2—Arrangement of mirrors for studying torsional strains

Fig. 1—Sketch of crankshaft, showing location of defective bearings

strain" curve. Owing to the irregular shape of the test specimen and the inadequacy of the ordinary laboratory methods for such important tests, the following method was used to determine very accurately the strains under various conditions of loading. Two small plane mirrors, mounted upon short steel stems and having both vertical and horizontal angular adjustments, were attached to the shaft by inserting the free ends of the stems or up-rights holding the mirrors into drill holes about  $\frac{1}{8}$  in. in diameter and  $\frac{3}{16}$  in. deep and securely held to the shaft by plaster of paris (see Fig. 1). One of these mirrors was placed in bearing 2 (Fig. 1), it being impossible to place it outside of the end crank, owing to insufficient space between the end crank in the grip in the head of the testing machine. The mirror was placed as indicated in Fig. 1. The total distance between mirrors was 23.40 in. At a distance of approximately 5 ft. 6 in. from each mirror, and in a plane nearly normal to the axis of the shaft, two Philadelphia leveling rods were erected, in a vertical position. Very nearly in line with each rod and mirror an engineer's transit was mounted several feet back of the rod, and at such an elevation that when focused upon the mirror the line of sight was exactly in a horizontal plane. By means of this apparatus and arrangement of instruments, the line of sight from either of the transits directed to its mirrors was reflected back to the corresponding vertical leveling rod, when the mirrors had been adjusted to the proper angle. It is evident, therefore, that for any angular position of the mirror, it was possible to take a

reading on either rod as seen in the mirrors with a horizontal wire of each transit. With mirrors clamped in such a way as to preclude the possibility of their shifting during the test, it was possible to record the slightest rotation of the shaft under varying torsional moments by the changes in readings upon the fixed scales of the leveling rods. The difference in the angular rotation of the two mirrors represents the angular displacement of two points on the shaft, a distance of 23.40 inches apart, since any slippage or rotation in the jaws of the testing machine was recorded by both mirrors. Therefore, the difference in the readings obtained of the angular movement of the mirrors was an accurate measure of the torsional strain. The tangent of the angle which either mirror makes with the vertical would therefore be equal to the rod reading, divided by the distance from the point of incidence to the rod.

Certain corrections, however, must be applied to this, because it could not be considered certain that the mirrors were exactly on the axis of revolution of the specimen, in which case they would have both a motion of translation and a motion of rotation.

Fig. 2 shows the relative positions of the shaft, mirror, rod and the transit, together with the necessary formula for reducing the rod readings to angular displacement, correcting the above described error.

Loads were applied and readings taken in increments of 5000 inch-pounds up to a load of 14,000 inch-pounds, beyond which the increments were reduced to 2000 inch-pounds. At a load of 70,000 inch pounds the increments

Fig. 3—Photographs of defective bearings under torsion

Fig. 4—Photographs of defective bearings after having been subjected to compression

*Figs. 5 and 6—Fractures of defective bearings. Upper and lower views are of the same specimens, but were taken with the light coming from opposite sides*

were further reduced to 1000 inch-pounds. Readings were taken to determine angular displacements of the mirrors as already explained, and the loads were read directly from the beam of the testing machine, which was accurately balanced. In order that the beam would be balanced exactly in the same position each time, two punch marks were made, one on the end of the beam and the other upon the fixed frame of the machine, between which a constant distance was maintained at each balanced load by the use of dividers. Sets were recorded at intervals of 5000 inch-pounds. Readings were continued up to a load of 80,800 inch-pounds, at which load the end of the shaft held in the head of the testing machine collapsed, making it impossible to hold the specimen and hence necessitating the discontinuance of the test. The failure at the end was due to the reduced section of metal at that point and was caused by combined torsional shear and lateral compression produced by the grips. At a load of approximately 60,000 inch-pounds the shaft assumed an appreciable set, amounting to 2 per cent of the strain at that load, but not until a load of 70,000 inch-pounds had been reached did the strain increase more rapidly than the loading. The true elastic limit of the shaft therefore must be assumed to lie between 60,000 and 70,000 inch-pounds. Assuming 65,000 inch-pounds as the elastic limit, this would correspond to a shearing stress of 53,500 pounds per square inch.

Inspection of the defective points with a magnifying glass showed that the so-called "hair-line" defects were visibly unaffected by the torsional stresses to which the shaft had been subjected and which, as already noted, was considerably beyond the elastic limit of the shaft as a whole.

After completing the torsional tests on shaft A, the bearings which contained the "hair-line" checks and which were unaffected by a torsional stress nearly 30 per cent in excess of the elastic limit were cut from the cranks. Defective bearings containing the "hair-line"

checks were also cut from shaft B. Both defective bearings cut from shafts A and B were subjected to a compression test, and in no case did incipient failure begin until the specimens had been compressed beyond the elastic limit, and considerable deformation had set in. The cracks which were ultimately produced when these specimens were subjected to compression either coincided exactly with the original "hair-line" defect or formed immediately adjacent and parallel to it, ultimately including the defects. In some cases the opposite side of the specimen, free from visible marks of any kind, failed to show cracks or else showed only minute cracks upon further continuance of the compression.

#### Compression Tests to Ascertain Cause of Cracks

However, it was especially noted that the defective side always cracked first. To ascertain conclusively whether the "hair-line" cracks really caused the ultimate failure under consideration by reason of some incipient weakness indicated by them on the surface, compression tests were made upon sections of bearings showing no surface markings. Before compressing these, fine scratches were put on the surface with an ordinary scribe at various positions and at different angles with the longitudinal axis of the piece.

This was done to determine whether upon deforming this piece artificial scratches on the surface would control the location of the crack formed under compression. Out of four cases only one of the cracks formed by the compressive stresses coincided with the surface scratch made by the scribe. All the others appeared to be entirely independent of the existence of such scratches on the surface. However, including all of these tests, it must be stated that no indications of cracks due to compressive stresses were noticed anywhere until the specimen had deformed considerably.

Figs. 3 and 4 show clearly the extent and nature of the above-described cracks produced on the specimens when subjected to compressive stresses. Fig. 4 shows

Fig. 7—Tensional stress-strain curve

the defective bearings tested under compression. Fig. 3 shows the perfect bearings artificially scratched. In two instances the compression test was purposely carried to complete failure, when the specimen broke into four pieces. The object of this was to enable a closer examination of the longitudinal fracture and a study of the structure of the material. As will be noted in Figs. 5 and 6, the structure was fibrous and curved or wavy in appearance, producing a rather twisted fracture. The reason for this particular type of fracture in chrome nickel steel shafts will be explained in the latter part of this article, dealing with the metallographic study of the material of the shaft. Figs. 5 and 6 are two photographs of the same specimen with the light on different sides.

#### Tension Tests

As previously stated, tension tests were made, irrespective of the defective points, to investigate the elastic properties of the material. The first test was made upon a specimen taken from the propeller end of the shaft, and was of the original diameter and shape. This piece was comparatively short and after allowing for the necessary length to be held by the grips only 3 in. remained clear between grips. Two sets of gage holes, 2 in. center to center, were drilled into the piece on opposite sides of the bar, so that strain gage readings could be taken. A 2-in. Berry strain gage was used to determine the strain produced on the piece at varying loads. Unfortunately failure took place outside the gage marks, and just inside the upper grips, thus preventing a representative determination of the proportional elastic limit or of the elongation. The maximum load carried was 213,000 lb. (or 100,100 lb. per sq. in. Fig. 7 shows the readings obtained. The fracture produced was mostly silky, except for a small area, which was crystalline, probably caused by a slightly eccentric loading due to the slippage of the grips on the specimen.

(To be continued)

#### Germans Using Wood Tires

A CORRESPONDENT of *L'Auto*, giving particulars of German transport vehicles captured during the recent Allied advance, says every vehicle has wooden tires, as no suitable substitute of an elastic nature has been discovered to counteract the rubber shortage. The tires on the front wheels are of the same section as the rubber tires usually fitted to French transport vehicles, but the rear tires are of a very flat section, 8 in. to 10 in. wide, and 4 in. to 5 in. thick. A detachable rim enables the wood tire to be changed, an operation which should be fairly frequent. The treads are grooved to reduce slipping and promote a grip of the roads.

## Culbertson Universal Joint

**E.** ESTAY CULBERTSON, Detroit, Mich., has developed a universal joint of simple construction, and which can be lubricated by means of oil. Two sectional views of the joint are shown herewith, and the principle of the device will be readily understood from these illustrations.

Instead of the conventional driving and driven flanges, Mr. Culbertson employs a one-piece hemispherical member which transmits the torque through bushings to a driving pin, which in turn transmits it to the driven member. There is also a central pin, perpendicular to the driving pin, which serves merely to locate the driven member. This central pin is held to the driving pin by means of a machine screw. The hole in the driving pin at this point is about 0.004 in. greater in diameter than the pin, this clearance being allowed in order to provide for wear upon the flat bearing surfaces of the driving pin. A wear of from 0.006 to 0.008 in. at the flat bearings is thus provided for.

One of the features of the joint is such an inclosure that oil lubrication is rendered possible. Instead of using the conventional spherical type of wiper, Mr. Culbertson provides a novel form of housing. It comprises a vertical slide supported on a spherical surface on the driven member. This slide is being pressed against a cork packing, lodged in the end face of an annular casting bolted to the hemispherical member, the spring pressing directly against a fiber disk. Mr. Culbertson's object in using fiber at this point is to obviate all noise. The surface against which the packing for lubricant retention operates is protected against dirt.

In order to hold the parts of the joint in assembly, the same as in the conventional construction, the holes for the bushings are drilled with their centers not in the parting plane but 1/16 in. to one side thereof, in the annular casting. This makes the opening of the hole virtually 0.007 in. smaller than the diameter, and the bushing is pressed into this casting and is firmly retained in place. This permits of removing the hemispherical member from the joint without disturbing the assembly of the remainder. The driven member is drilled out from the end, in order to save weight. The construction calls for only two bushings, and there are parallel bearings on the driving pin. The slot in the driven member is made by simply pushing this part against a milling cutter.

Culbertson universal

# Status of the Unproductive Worker

## Are Not Salaried Workers Equally Entitled to Representation in Organization with Skilled and Unskilled Employees?

By Harry Tipper

THE attention of industrial organizations has been directed to skilled and unskilled workers engaged in the actual manufacture of the product by the activities of the organized bodies of labor and their constant appeal for public attention to such an extent that there is some danger of losing sight of the army of other workers whose demands are less vociferous but whose case is none the less important.

It is interesting to note that in some of the organization plans which have admitted the general body of labor in the establishment to a share in the responsibility for their own conditions a specific statement is made that *no salaried employee of the company shall be entitled to a vote in the election of the representatives of the working body.*

A number of individual plans have been made in the last 10 years, and particularly in the last 4 years, in various lines of industry, but very few of these plans seem to have recognized the bodies of employees who are not supervisors, who have no responsibility in controlling the operations, and who are equally important with any other bodies of labor as individuals, and equally necessary to the success of the organization.

It is true that for the most part these workers are not organized, and any demands which they have made have been of an individual character; they are not paid by the hour; and as a rule they do not receive extra pay for overtime. It is also true that the turnover of such labor is comparatively small, the permanency of occupation is very much greater, and the general tendency to stable conditions of work and of wage makes the problem an entirely different one.

### Reasons for Neglect of Some Workers

The reasons for this apparent neglect of a considerable body of workers in the systems of representation which are being considered and adopted by a number of concerns can be readily stated. The lack of organized protest has resulted in a lack of public attention. The stable character of the work and the orderly necessities of such work have produced dislike for the methods of skilled and unskilled labor protest which are evidenced by the failure of the occupational organizations of labor in this country to extend themselves into these fields.

Attempts have been made from time to time to organize one occupational branch or another of these workers without any success. It is natural for us all to consider those difficulties which are constantly brought to our attention, and in business the justification of the organized labor leader lies in the fact that the demands of organized labor, no matter what their justice, have resulted quite continually to the advantage of those branches of workers.

From the manufacturer's standpoint, however, any system of legislative organization in his whole industrial unit which places the workers who are engaged in actual production in one category and the supervisors or governors in another, bringing these two together with a

joint system of responsibility and discussion, but fails to recognize the necessities of the somewhat smaller body of workers who are neither supervisors nor engaged in the actual production—any such system cannot work out to the fullest advantage because it will eliminate from the discussions and from the responsibility of decision those workers who represent an orderly and valuable part of the industrial unit.

It is not so much a question of justice being done to this part of the organization, although it would be possible to show there is just as much necessity for an examination of this point, but it is the question of the value of this part of the working organization in the discussions of the legislative requirements.

Perhaps these workers represent the individualism which must be retained to an extent if the organization is to live, and their traditions of service, as well as their social surroundings and general habits of living, induce them to regard without entire approval the general movement toward purely collective action.

### Not Benefited by Continual Protest

They have not been benefited by the continual protests of organized labor; in fact, the increased wages and the improvement of working conditions in the factory have at times militated against their own economic advancement.

On the other hand, they have not been served with such notable justice by the employer that they are sympathetic with his viewpoints, or to be regarded as his representative. In general they have paid more for the training which precedes their service and received less for the years of their service than the skilled workers who have organized themselves into occupational units.

Their point of view in the organization policies which would be recommended by the legislative bodies of workers and supervisors together would be of very great advantage in placing the wage system upon a proper basis and in the consideration of conditions of work.

Furthermore, the exclusion of this body from the general considerations which come up before the legislative and judicial machinery established within the industrial unit must inevitably arouse discontent, a weakening efficiency, an increased turnover, and, finally, result in the loss of good material from these branches to the ranks of the skilled and unskilled laborers who form a part of the actual production force.

It is true that schemes of old-age pensions, continued salary during sickness, continued work during times of depression, have been usual in a good many organizations for this branch of the working force, and to that extent in the stability of the labor they have been treated with less rigor.

It is also true that the stability of their wages during times of depression must be compensated for by less advance in times of prosperity. It is nevertheless clear that if a careful analysis be made of the extent of the training required to produce efficient workers in these

occupational branches, and a careful examination be made of their importance, in comparison with the more active occupational branches of the workers, that *they have not received the attention that should be given to them by the manufacturer in the interests of his own efficiency and full content in his own organization.*

If we accept unconditionally the belief that control in industry should be vested in the stockholders, and exercised by the elected officers of those stockholders, and that labor is a commodity to be secured like other commodities at whatever price it is necessary to pay, then these considerations are without any bearing.

There is little danger of organized effort on the part of these workers to attract public attention in the immediate future, and although their sympathies are quite frequently with the other workers because of a natural similarity in aspiration, they are usually more conservative in their actions and not likely to be so readily caught up in radical movements.

If we accept, however, the position which has been taken by many industrial leaders of foresight and prominence, that labor is not a commodity but a human service, exacting in its fulfillment the very life of the worker, and demanding a consideration of the individual economic, social and political aspirations, these very facts should in themselves indicate the necessity, and indeed the advantage, of instituting organization plans which shall include this valuable part of the industrial group in some effective way.

### Consideration of Essentials of Co-operation

If we go further and accept what has been stated by some of the most discerning and successful of the industrial organizers in the last two or three years, to the effect that a reasonable degree of the spirit of co-operation, a thorough incentive and some measure of understanding will increase the economic value of the individual worker, then the necessity for the consideration of these neglected branches of the working body becomes apparent.

It is obvious that the tendency which was forecast in 1915 in the writer's book "The New Business" to invite the worker to exercise a greater responsibility in the determination of his working conditions is becoming manifest in the actions of a number of large and successful organizations which have adopted plans of this kind.

It should be equally obvious that any such organization plans should take in not only the skilled and unskilled workers who are engaged upon actual production but that equally important, although smaller, body of workers who are for the convenience of industry paid what is termed a salary and whose working conditions are more stable, but who are not concerned with the control of the operations or with the supervision of other labor.

It is true, of course, that the representation from such workers would have to be worked out in a somewhat different way from that which is usual in the organization plans providing for the representation of the skilled and unskilled workers who are engaged in the actual productive work.

In such an organization plan, for instance, as that which was discussed last week of the Midvale Steel & Ordnance Co., the number of such workers in any one of the plants might not be sufficient to provide them with a representative from their own ranks on the same basis as prescribed for the workers in the mill.

The question would have to be considered in each case as to whether it were desirable that they should be entitled to a vote along with the other employees specifically named in the organization plans or whether a change in

the representation should be made to permit of their securing a representative from their own ranks to sit upon the joint committees.

The plan of the Colorado Fuel & Iron Co., which is similar to the other plans in the steel business, states specifically as follows:

"Shall state that employees being wage earners in the employ of the company at the time of the meeting and for at least three months immediately preceding, but not salaried employees, shall be entitled to be present and vote." This means that the laborer of whom the company knew nothing and who had no interest in the company four months before the voting date can vote provided he arrived at the camp and was put to work three months before that time, whereas the man who had been paid to act as stenographer or record clerk at the same camp, and has been in the employ of the company for 10 years previous to the time of the vote, is specifically eliminated from voting because he has been paid on a weekly salary instead of on a time card.

It would be unwise, in the attempt to allay discontent, by providing a co-operative organization, to transfer that discontent from the ranks of the skilled and unskilled wage earners to those employees who have been, up to the present, the more stable branches engaged upon the necessary work of the industrial unit.

It is obvious that in no representative system adopted for organization purposes should any supervisor of labor or direct representative of such supervisor be included in the voting population for men who are to represent the employees of the organization, but this reason does not seem to be sufficient to eliminate all employees working on a salary without regard to their position and responsibility.

The fact of the matter is that there is no particular problem here at any one moment; there is no question of the stoppage of production or of general strikes; there is no distinct tendency to disorganization, and the thought has been put largely upon the problem and not thoroughly upon the principles behind it.

### Organization Should Begin with Details

It is well that, as stated previously, new organization plans of this kind should begin with small matters and gradually develop into the handling of the larger problems; but the machinery of the organization should be established in such a way that it can take care of practically every possible problem which may come up as it grows together and functions properly.

No organization can do much good unless the spirit of co-operation is there, and the spirit of co-operation must be shown first by the employer in his organization plans; but no organization plan can develop the spirit of co-operation thoroughly where it begins by eliminating a certain body of workers or a certain portion of the working force from participation in its actions and from a sense of unity with it.

The reason why organization plans such as we have mentioned are being adopted by concerns every few days is to be found in the necessity for common responsibility where there are common interests. The organization of industry was divided by the system of labor unions and by the increasing solidarity of labor, and these plans have been adopted to eliminate the division and bring the whole body together in common purposes.

It is a little surprising, therefore, that some of them should have specifically eliminated from this common responsibility a body of workers whose interests are no less important in the organization unit and whose incentive and content are just as necessary to the proper productive efficiency.

# Air Flow Through Poppet Valves

## An Experimental Investigation of the Resistance to Gaseous Flow Through Poppet Valves of Different Diameter and Lift—Single Versus Double Valves

**A**MONG the problems which have confronted explosion engine designers for some years is that of the dependence of air flow or gas flow through poppet valves upon the valve diameter and lift. This question comes up in a consideration of the advantages of double valves or four valves per cylinder, as now used in some automobile engines and many aircraft engines. It has not been definitely known in the past whether the flow for a uniform pressure drop would increase directly as the diameter and as the lift, and this made it impossible to make a comparison, on theoretical grounds only, between the capacity of two small valves of given dimensions with one large valve.

Considerable light has been thrown on this problem by an investigation made by the Clarke Thomson Research, under the direction of the National Advisory Committee for Aeronautics, the results of which are embodied in Report No. 24 of the committee, just published.

The apparatus used in the tests consisted principally of a centrifugal blower, a model cylinder and U tubes for measurements of pressure. The blower was one of special design with a balanced rotor 11.25 in. in diameter, composed of 10 forward curved blades. An electric motor furnished the power, rheostat control permitting speeds from 3000 to 6500 revolutions per minute, corresponding approximately to pressures of 9 to 32 in. of water. The number of impulses varied from 30,000 to 65,000 per minute, affording practically continuous flow. The blower was connected to the cylinder with rubber hose, care being taken to see that the alignment of the hose remained perpendicular to the face of the cylinder at point of entrance throughout the tests.

### Dummy Engine Cylinder Used

The cylinder is shown in longitudinal cross section in Fig. 1. The cylinder head was carved out of white pine and carefully finished. At the entrance end, the passages leading to the valves were cylindrical in form with axis perpendicular to the cylinder axis and 2.5 in. in diameter, the passages then curved as shown to the ports. The approach to the large valve, which had a diameter of 2.5 in., was circular in cross section at all points. The approach to the pair of valves on the opposite side of the cylinder became narrower in the plane of the cross section shown, and widened laterally to smoothly divide, about 1.5 in. from the ports, into two passages of 1.75 in. diameter. The angle between the valve axis and the cylinder axis was 15 degrees. No valve guides or bushings extended into the passages.

The diameter of the counterbore was 5.75 in. and of the cylinder proper 5 in. The valves were seated with a bevel of 30 degrees in the two planes forming the cylinder head. The diffuser shown was constructed of thin brass soldered together and inserted so as to divide the whole area of the cylinder at that point into rectangular passages about  $\frac{1}{2}$  in. square and 2 in. long.

The jet at the opposite end of the cylinder was likewise carved out of white pine as shown, and was connected to the cylinder head by a length of 5-in. wrought-iron pipe, smoothly galvanized inside, used to obtain sufficient length for rectification of the air current. Gaskets and shellac were used at the joints and the assembly drawn together with four long bolts extending from end to end, outside the cylinder.

### Three Sizes of Valves Tested

In addition to the single valve with a diameter of 2.5 in. and the pair of valves with diameters of 1.75 in. already mentioned, another pair with diameters of 1.25 in. was tested.

False seats were used with this smaller pair, consisting of turned hardwood rings, carefully fitted to the 1.75 in. seats and beveled to receive the smaller valves. These false seats obviously left a circular shelf or projection 0.25 in. wide immediately above the ports. As a matter of interest, two readings were taken with these shelves projecting above the port, but before running off the main test on these 1.25-in. valves, the lines of the passages were smoothed off by filling in above these projections with putty.

The valves were all designed on similar lines with the exception that the smallest pair had stems  $\frac{5}{16}$  in. in diameter, to fit the guides used for the larger pair, this dimension being

Fig. 1—The test cylinder

40 per cent larger than true proportion dictated, equivalent to a reduction of 0.022 sq. in. or 1.8 per cent of the port area of the smaller pair.

The Pitot tube shown in the jet in Fig. 1 was clamped in position at the axis of the jet throughout the tests, velocity readings being taken as later described. The dimensions were  $\frac{3}{16}$  in. outside dia. and about 2.5 in. in length. The impact end was gradually rounded and the static holes were four in number, about 0.02 in. dia., smoothly perforating the outer wall.

A static tube of  $\frac{1}{4}$  in. dia. penetrated the central portion of the cylinder, reading static pressure of the air column after passing the valves and the diffuser. This is for convenience termed the "lower static."

Static tubes of  $\frac{1}{4}$  in. dia. also tapped the flow where the air column entered the passage leading to the valves. These are for convenience termed "upper static," only one being used at a time, as indicated by its position with respect to the valves. All statics were slightly rounded on the inner periphery, and the end kept flush with the inner surface of the cylinder or passages, and so located as to be perpendicular to the direction of air flow.

The upper and lower statics were connected to the two legs of a U-tube to read directly the pressure drop through the valve, and also connected to other U-tubes to read the upper static and lower static head separately.

All U-tubes had an inside diameter of about 0.25 in. and were vertical with the exception of one, which was inclined at a slope of 10 to 1 to read with greater accuracy velocity pressures of 3 in. or less.

A centigrade thermometer was clamped with its bare bulb in the air jet at a point about 1.5 in. outside the apparatus. A similar thermometer was hung on the wall for readings of room temperature.

The moisture content recorded is the average for the period indicated, as taken from a recording hygrometer, the variations being but slight, as were those of the barometer.

It is not necessary here to give a full explanation of the methods of measuring the velocity and quantity of air as

Fig. 2—Variation of flow with pressure drop and lift

given in the report. The results are embodied in tables and diagrams, but only the latter are reproduced here.

The purpose of this investigation was primarily to secure comparatively accurate comparisons as between the capacities of the different valve combinations, rather than to secure absolute quantitative determination of the flow in any case. It will readily be seen that the velocity and quantity of air flowing through the jet at the outlet of the system will be proportional to the square root of the velocity pressures read by means of the impact tube in the jet. The vertical scale of the following graphs is based on these readings and is termed for convenience "proportional flow."

#### Pressure Drop and Flow Graphs

The horizontal scale is laid off to the square root of the pressure drop through the valve combination tested, which is deemed much preferable for the present purpose to the use of the pressure drop itself.

Wherever "proportional flow" is used as a basis for plotting in the various plates shown, it should be remembered that this refers to flow through the same jet in all cases, without respect to the valve opening or pressure drop causing the flow, and that the various results so obtained may therefore be directly compared, owing to the use of this jet as the common medium of measurement in all tests.

As to Fig. 2, it is true that the scale is small and that plotting to square roots tends to reduce the magnitude of any irregularities in the points obtained, but the close coincidence of the points with the straight graphs passing through the origin seems to warrant the conclusion that the actual velocity through the valve at any given lift varies directly with the square root of the pressure drop, at least within the limits of these tests, as does the theoretical velocity. It further follows as a general rule within these limits that the coefficient of efflux does not vary with the pressure drop. Certain limitations upon this conclusion may be required, however, and will be discussed in connection with the graphs showing the variation of the coefficient of efflux with the lift.

Curves of equal velocities have been superimposed upon

the graphs of Fig. 2, to show the approximate velocities through the valves in feet per second. At about the average conditions of the tests, namely, 80 deg. F., 55 per cent humidity, 68 deg. wet bulb, and 29.72 in. barometer, air weighs 0.0717 pounds per cubic foot. Inserting this value in the equation  $V = 18.275 \sqrt{p/w}$  gives  $V = 68.2 \sqrt{p}$ . In other words, assuming air at this density, multiplying the vertical scale by 68.2 gives actual velocity through the jet in feet per second, and applying the same correction to the horizontal scale gives theoretical velocity through the valves. The actual velocity through the valves may then be obtained either by applying the ratio of areas to the vertical scale of jet velocities or by applying the proper coefficient of efflux to the horizontal scale of theoretical valve velocities.

Curves representing actual velocities of 100, 200 and 300 feet per second through the valves have been laid off by the former method and agree fairly with results obtained by the latter method, except as to irregularities in some of the points used for plotting the coefficient curves later presented.

These curves may be used to approximate the actual pressure drop necessary to produce a given velocity. For example, in Fig. 2 it is seen that the pair of 1.75-in. valves with 0.20 lift indicates a velocity of 200 feet per second at the ordinate corresponding to 3.55 in the horizontal scale or 12.6 in. of water or 0.455 pounds per sq. in. as the required pressure drop. It should be noted that these velocity curves are merely approximate and that errors up to 5 per cent or so may be found.

#### Variation of Flow with Valve Lift

It is evident that the intercepts on any ordinate on Fig. 2 will represent the variation of the flow with the valve lift at the pressure drop corresponding to the ordinate selected.

Fig. 3, lower chart, presents such curves for the three valve combinations, plotted from intercepts on the ordinates corresponding to a pressure drop of 16 in. of water, the ordinates numbered 4 in the square root scale. The curve of flow for the single 2.5-in. valve lies between those of the pairs of valves at all lifts. It is found to be very nearly equal to that of the smaller pair for low lifts and approximates that of the larger pair at the higher lifts.

These curves are plotted against valve lift in inches, but for convenience the points equal to one-quarter and one-half diameter have been marked on each curve. By interpolation between these points and others similarly located, the approximate curve of flow for two valves of 1.5 in. dia. is presented. This indicates a flow quite closely equal to that of the single 2.5-in. valve up to a lift of about 0.6 in.

Lift in inches.....	0.125	0.25	0.375	0.500	0.625	0.750
2 valves, 1.75 inches..	137%	129%	125%	119%	116%	113%
2 valves, 1.50 inches..	114%	106%	101%	94%	90%	87%
1 valve, 2.5 inches....	100%	100%	100%	100%	100%	100%
2 valves, 1.25 inches..	85%	77%	72%	65%	59%	54%

<sup>1</sup>Interpolated.

The points connected to the curves by broken lines indicate, to vertical scale only, the flow with the valves reversed. This might be considered equivalent to the flow with the valves at an infinite lift, which agrees with the horizontal trend of the curves, but more practically, these points represent the maximum limit of flow through the respective ports at this pressure drop. These curves, comparing performance upon a basis of equal lift in inches, are particularly applicable where it is conceded that mechanical features generally limit the possible lift regardless of valve diameter.

On the other hand, it is often asserted that the proper limit of valve lift is a function of the diameter, and for purposes of comparison on this basis Fig. 3, upper chart, has been prepared from the curves last discussed, changing the horizontal scale to read in per cent of the diameter of each valve. In the case of pairs of valves, the flow of both is plotted against the lift, expressed in per cent of the diameter of one valve only.

The result of this transposition is at once apparent. The intercepts on an ordinate very closely agree with the proportionate cross-sectional port areas of the several valve combinations, and in the case of the two curves corresponding to valve combinations with equal cross-sectional port area,

the curves coincide within the probable error of the work. Up to a lift of 0.5 dia. the coincidence is all the more exact if it be remembered that the two 1.75-in. valves have an area about 2 per cent less than the single 2.5-in. valve.

From this it would appear reasonable to infer that under fairly similar conditions different valves or combinations of valves have capacities in proportion to their respective cross-sectional port areas, when the lift in each case is same per cent of their respective diameters.

It also seems logical to infer that the theory of the hydraulic mean radius has but little application to the losses in poppet valves, it being more properly applicable to what may, for convenience, be termed surface friction, or actual rubbing of the moving fluid upon the surrounding wall, whence its derivation—the relation of cross-sectional area to perimeter in contact with the moving fluid.

It is evident from an inspection of the curves in Fig. 3 that a lift equal to one-quarter diameter develops less than 67 per cent of the full capacity of the port, and that a lift of one-half diameter develops 80 to 90 per cent of the full capacity.

#### Coefficient of Efflux

The coefficient of efflux is taken as the ratio of the observed mean velocity through the valve to the mean velocity which would theoretically result from an equal pressure drop. Assuming that the temperature, density and humidity of the air are the same at the valve as at the jet, this coefficient may be obtained directly from the relation of the areas and the proportional velocities observed. The proportional velocity at the jet multiplied by the ratio of the jet area to valve area gives the proportional velocity through the valve. If the ratio of this velocity to the square root of the pressure drop be taken, the result is the coefficient of efflux. To be more exact, this should be multiplied by 0.99, the coefficient of the jet.

The above short method may be justified by developing the usual equation  $V = \sqrt{2gh}$  in the units here most convenient:

$V$  = velocity in feet per second.

$g$  = acceleration constant of gravity in feet per second.

$h$  = head of air in feet causing the flow.

Substituting the head in inches of water:

$$V = \sqrt{2gp} \frac{62.31}{12w} = \sqrt{2gp} \frac{5.192}{w} = 18.275 \sqrt{\frac{p}{w}}$$

where  $w$  is the weight of water in pounds per cubic foot, 62.31 is the weight of water in pounds per cubic foot, and  $p$  is the pressure head in inches of water.

This equation is deemed sufficiently accurate for the low pressures here subjected to examination.

Now, if  $A$  = the jet area, and  
 $a$  = the valve area,

the mean velocity through the valve is  $18.275 \frac{A}{a} \sqrt{\frac{p}{w}}$  where  $p$

is the velocity pressure and  $w$  the density of the air at the jet.

The theoretical mean velocity through the valve is  $18.275 \sqrt{\frac{P}{W}}$  where  $P$  and  $W$  are, respectively, the pressure drop and the density of the air at the valve.

$$\text{The Coefficient of Efflux} = \frac{18.275 \frac{A}{a} \sqrt{\frac{p}{w}}}{18.275 \sqrt{\frac{P}{W}}} \text{ or } \frac{A \sqrt{p}}{a \sqrt{P}}$$

where the density of the air is the same in the jet and in the valve.

#### Basis for Valve Area Calculation

In computing the coefficient the valve area has been taken as  $\pi D h$  for all lifts. It is realized that for small lifts the aid of trigonometrical formulæ may be invoked to determine accurately the least area of opening, but the same formulæ are not applicable at higher lifts. Moreover, they are only justifiable upon the theory that the lines of flow are parallel, which does not obtain for any except the smallest lifts.

Fig. 3—Variation of flow with valve lift

In Fig. 4 the coefficients of efflux will be found, plotted against valve lift in the lower chart, and against lift in per cent of diameter in the upper. These coefficients are considerably higher at low lifts, a feature somewhat difficult to explain satisfactorily. Both friction and dynamic losses should be greater at low lifts, as the ratio of perimeter to area is then greater and the angular deflection sharper. It seems probable that there is an approximation to a jet action at low lifts, the discharge taking place at a region of relatively low pressure, somewhat after the manner of the true jet used for measurement at the outlet end of the cylinder. The comparatively high discharge efficiency of any such jet seems to make this the most probable explanation of the high coefficients.

If such jet action takes place, the pressure in the valve area should approximate that of the cylinder itself, and the theoretical velocity through the valve should be computed upon the lower pressure rather than the higher. This would reduce the error involved in computing the theoretical flow and coefficient upon the assumption of atmospheric density in the valve, as has been done.

#### Pressure Used in Tests

The maximum static pressure in the cylinder was 17.5 in. of water. As a pressure of 1 in. of water is equal to a pressure of 0.5768 ounce per sq. in., this would equal a pressure of 10.09 ounces, or 0.631 pound per sq. in., or an absolute pressure of 15.23 pounds per sq. in., 755 millimeters observed atmospheric pressure being equal to 14.60 pounds per sq. in. The density of the air varying with the absolute pressure and the ratio of absolute pressures being 1.046, the error involved under the above assumptions would be about 2.2 per cent as the density of the air enters the equation under the radical sign. This error would be materially less at the lower lifts, the pressures in the cylinder then being considerably less. No appreciable error would appear to be introduced by assuming equal temperature and equal humidity at valve and jet for any given valve opening and pressure drop.

Referring again to Fig. 4, it will be noted that, in lower chart, where the coefficients are compared at the same abso-

Fig. 4—Coefficient of efflux plotted against valve lift

lute lift, the differences between the three valve combinations are quite considerable, and that at the very low lifts the points plotted present some irregularities. The curves have been drawn to conform to the greatest number of points reasonably possible, and the curves in the upper chart have been plotted from those in the lower. The points for the two larger combinations so nearly coincide in the upper chart that but one line has been drawn.

The relative intercepts of the coefficient curves in the lower chart at various absolute lifts, expressed in per cent of the values for the single 2.5-in. valve, are presented in Table 1.

TABLE 1

Valve lift in inches.....	Relative coefficient of efflux.				
	0.125	0.25	0.375	0.50	0.625
2 valves, 1.75 inches diameter....	96%	94%	91%	89%	86%
1 valve, 2.5 inches diameter....	100%	100%	100%	100%	100%
2 valves, 1.25 inches diameter....	87%	73%	73%	69%	64%

In the upper chart it will be seen that when compared on a basis of equal valve lifts, expressed in per cent of diameter, the coefficients are much more nearly equal, the curves for the two larger combinations coinciding, and that for the small valves being but little lower. It seems entirely probable that even this small difference is largely caused by the converging lines of the passages leading to these small valves, as before explained. The comparative values are here shown.

TABLE 2

Valve lift in per cent of diameter	Relative coefficient of efflux.				
	0.10	0.15	0.20	0.25	0.30
2 valves, 1.75 inches diameter ..	100%	100%	100%	100%	100%
1 valve, 2.50 inches diameter....	100%	100%	100%	100%	100%
2 valves, 1.25 inches diameter....	93%	92%	91%	90%	90%

#### General Considerations

The only experimental investigation of the flow of air through poppet valves of which record was found in the technical publications was carried out as a thesis by R. M. Strong and F. W. Hollman, and later published by Prof. C. E. Lucke under the title "Pressure Drop Through Poppet Valves," Vol. 27, Transactions of the American Society of Mechanical Engineers (1905). Prof. Lucke seems to have

been the first to call attention to two noteworthy characteristics, which are found to be supported by the data here presented; first, that the coefficient of efflux, computed for air at atmospheric density, is nearly constant for all pressure drops; and, second, that this coefficient is much larger for low lifts. Tests were made both with continuous flow and intermittent flow, the latter being as nearly as possible similar to actual operating conditions for the two gas engines tested, and it was found that the coefficient of efflux for continuous flow was not the same as that for intermittent flow, even at the point of zero acceleration.

It is patent that extreme care should be exercised in any attempt to apply the results of continuous-flow experiments to flow under operating or intermittent conditions, since inertia and resonance effects in the inlet manifold will obviously make great differences in the absolute quantities, and these effects will vary with the type of manifold used. Moreover, the pressure drop, velocity, and coefficient will obviously vary with many other factors as between different engines, different speeds for the same engine, and as to instantaneous values at different points of the stroke for a given engine at a given speed.

#### Question of One or Two Inlet Valves

However, in the question of design as to whether two inlet valves or one should be used, it is believed the comparative results here presented may be made to serve a real purpose. It is difficult to perceive any reason why the comparative relations obtaining between these three valve combinations for continuous flow should not find some parallel in the comparative relations between the same three combinations for intermittent flow, if no other variables are permitted to affect the comparative results in the latter case. Only inherent differences between the three combinations, effective with intermittent flow and noneffective with continuous flow, or vice versa, would appear capable of affecting this parallel, and it is improbable that such differences, if any, are of great magnitude.

The dimensions of the cylinder model used for these experiments offer a ready basis for discussion, and are commonly encountered in aviation engine practice, the bore being 5 in. and the diameter of combustion chamber 5.75 in. A combustion chamber of this size permits the use of two valves of 2.5 in. dia., or four valves of 1.875 in. dia., inclined at 15 or 20 degrees to the cylinder axis in both cases. Four 1.75-in. valves can be placed in a 5.5-in. cylinder head inclined, or a 5.75-in. cylinder head vertical; and four 1.5-in. valves are even more readily accommodated in a 5-in. cylinder head, or a cylinder having the combustion chamber the same diameter as the cylinder proper. These valves may be placed vertically, and the cylinder is much more easily machined. The combustion chamber will have better proportions, and the slight increase in cylinder height will be more than offset as to over-all height by the saving in spring length.

#### Advantages of Two Smaller Valves

Two 1.5-in. valves will have a flow capacity equal to one 2.5-in. valve at the same pressure drop and the same lift, will present but 72 per cent as much area to any pressure in the cylinder at the time of opening, and will weigh but 56 per cent of the weight of the single valve, assuming that the weights vary as  $D^{2.5}$ , which is approximately correct for these sizes. Assuming any reasonable pressure in the cylinder at the time of valve opening, and spring tensions in proportion to valve weights, it is evident that the two small valves will require less than half the power to open them, and this will be a direct saving of mechanical loss, as valve action is not the type of reciprocating motion which can return during one portion of the stroke energy stored during another portion, excepting only the energy stored in the spring.

It has been said that valves in pairs are more difficult to cool than single valves, but this does not appear to stand analysis. The proportion of the 5-in. cylinder head occupied by the small valves is only about 95 per cent of the proportion of the 5.75-in. head occupied by the large valve. The circumference of the two valves is 20 per cent greater than that of the single valve, and although the seats would have some

what less width, the distance of heat flow in this direction would be but 60 per cent as great. As to the portion of the heat which flows to the guide, the conditions are also somewhat in favor of the small valves, the distance to the water-cooled portion of the guide being less and the proportion of water-cooled guide greater.

In one example of foreign engine design dual valves of about this size are lifted to one-half diameter, and give entirely satisfactory operation at speeds up to 2200 revolutions per minute. The possibilities in this direction are largely untried, but the negative work used in overcoming valve resistance to inlet flow might be reduced with small valves at high lifts and the volumetric efficiency increased, without introducing serious mechanical difficulties. This, of course, is contrary to the principle of using low lifts to secure a higher coefficient, but still the over-all result might be beneficial.

The comparison of a single 2.5-in. valve to a pair of 1.75-in. valves may be analyzed in much the same manner, and as to heat conditions the result would seem slightly in favor of the pair. If lifted 0.375 in., the capacity will be 25 per cent greater than that of one 2.5-in. valve, according to the experimental results, or the resistance will be but 64 per cent as great, the resistance varying approximately with the square of velocity or capacity. This should result in higher volumetric efficiency. The superficial area of the two combinations would be practically equal, but the weight of the pair would be but 82 per cent of that of the single valve, with correspondingly reduced total spring tension and slightly reduced mechanical loss.

#### Comparison With Mercedes and Benz Results

Interesting comparisons may be drawn from data published by the *Automobile Engineer*, London, Vol. VII, Nos. 105-6-8-9 (1917), covering Benz and Mercedes engines, each make being constructed in both 2-valve and 4-valve models. Except for the valve changes and an increase in compression ratio from 4.50 to about 4.90, the design of the 4-valve models is much the same as that of the respective 2-valve types. The data are represented in Table 3, the ratio of volume to horsepower and brake mean pressure being given for the rated power at 1400 revolutions per minute for each engine. The "valve-factor" is one-half the product of inlet-valve opening area by the number of degrees open divided by the displacement of one piston, affording a ready index of relative valve capacity.

TABLE 3

Engine	Benz 4-valve	Mercedes 4-valve	Benz 2-valve	Mercedes 2-valve
Bore, inches	5.71	6.30	5.12	5.51
Stroke, inches	7.48	7.09	7.09	6.30
Piston displacement per cylinder, cubic inches	191.38	220.82	146.05	150.20
Piston displacement, total cubic inches	1,148.30	1,324.90	876.30	901.20
Valve port diameter, inches	2.04	2.17	2.42	2.87
Valve lift, inches	.465	.398	.433	.440
Inlet valve opening, square in.	2.99	2.72	3.29	3.70
Rated horsepower	280	260	160	160
Rated revolutions per minute	1,400	1,400	1,400	1,400
Maximum horsepower	260	270	184	162.5
Maximum revolutions per min.	1,650	1,650	1,400	1,400
Inlet-valve opening, degrees	245	228.3	2.40	213
Area inlet pipe, square inches	3.65	6.85	2.96	3.54
Cubic inches piston displacement per horsepower	4.99	5.10	5.48	5.63
Compression ratio	4.91	4.94	4.50	4.50
Valve factor	3.80	2.82	2.70	2.62
Brake, mean effective pressure	113	107.5	103	102

The valve factor for the 4-valve Mercedes is but slightly larger than that of the 2-valve, and the mean effective pressure is increased only 5 per cent, which is practically accounted for by the increase in compression ratio from 4.50 to 4.94. In the Benz 4-valve, the factor is increased 35 per cent and the mean effective pressure increased 10 per cent, only about one-half of which can be due to the increase in compression ratio from 4.50 to 4.91.

In Fig. 5 a comparison is made of the power output of these four engines plotted against gas velocity through the inlet valve. These velocities are computed for this comparative purpose as the ratio of piston displacement per explosion to one-half of the product of valve-opening area by the time of the opening. The broken curves represent the 4-valve Benz and Mercedes, respectively, reduced approximately to compensate for difference in compression ratio.

In conclusion, a summary of the results experimentally derived is presented. It should be borne in mind that the number and character of the experiments is not such as to render them final and conclusive.

#### Conclusions

1. The coefficient of efflux is practically constant, for all pressure drops (at least below 1 pound per square inch) where the lower pressure is approximately atmospheric, and the theoretical flow is computed upon air at atmospheric density.

2. Under conditions of general similarity, the coefficient of efflux is very nearly the same for valves of different sizes, at equal lifts expressed in per cent of their respective diameters.

3. Lifting a valve one-quarter of its diameter may develop an area of opening geometrically equal to its port area, but affords a capacity less than 67 per cent of that of the unobstructed port, at the same pressure drop; a lift equal to one-half diameter develops 80 to 90 per cent of this maximum capacity.

4. At the same pressure drop, one valve of diameter  $D$  and lift  $h$  is equal in capacity to:

First, a pair of valves of diameter  $0.707 D$  (equal port area) and lift  $0.707 h$ .

Second, a pair of valves of diameter  $0.6 D$  and lift  $h$ , for values of  $h$  not exceeding about  $0.25 D$ .

REGARDING the relative merits of case-hardening and oil-hardening compositions, in certain kinds of service case-hardened gears are undoubtedly superior, while in others oil-hardened are best. As a general rule, the oil-hardened gear can be counted on for steady, uniform wear. Where a case-hardened gear is used the wearing down of the case to the core at any point means that the gear is gone. Similarly, if the case cracks it will flake, and the gear is gone. The actual cost of case-hardening will usually run slightly greater than that of oil-hardening. Oil-hardened gears always give a lower scleroscope hardness than case-hardened gears, but this is not a criterion of wearing quality, as the toughness of the material always enters in.

## Camp Holabird—Largest Truck Overhaul Depot

**Present Capacity for Assembling 30 Trucks a Day and Crating  
22 an Hour for Shipment—1400 Trucks a Month  
Overhauled, Crated and Shipped**

**B**ALTIMORE, MD., Dec. 16—One hundred and fifty acres of uncultivated land converted into a beehive of industry; a motor truck overhaul plant of 200,000 sq. ft., capable of fully assembling 30 motor trucks per day; a packing plant 800 by 200 ft. with a capacity for completely crating 22 trucks per hour; a storage and shipping department with a capacity for handling 2200 tons of spare parts monthly—in brief, a complete organization of 7000 men and a factory which with a slight expenditure could be the equal of many truck producing plants—this is Camp Holabird, the largest motor truck overhaul depot in the world, and erected within the last 10 months at this city.

The illustrations on this page show the best indication of the remarkable development of this camp in less than a year. A description which appeared in these columns 8 months ago

told of the beginning of activities and showed illustrations of the grounds and the laying of foundations for some of the buildings. At that time the camp housed less than 500 men.

To-day it has an organization of 7000 men.

It has cleared as many as 1400 trucks a month, overhauled, crated and shipped them.

It has trained as many as 4000 motor mechanics within a month and shipped them abroad to the American Expeditionary Forces.

It has had as many as 7000 trucks in storage at one time.

It has completely torn down and overhauled and assembled 48 trucks in a day.

It has shipped 2200 tons of spare parts in a month.

It has disassembled and completely crated and shipped 115 trucks in a day.

*Shows the crating shop in the center, with the electrical crane which loads directly to the freight*

se in the center and trucks to the right

Occupying land to the northeast of Baltimore, the camp is to-day a mass of machine shops, tents, barracks and warehouses. The overhaul shop, 497 by 480 ft., one story high, comprises 28 departments, including chassis bays where the trucks are torn down, where the engines are completely inspected and repaired, and the final test room, where the trucks are reassembled and inspected, following which they are given a 50-mile road test and sent to the reserve park. In addition there are complete welding, drilling, painting, wood working, tire repair and other departments.

Painting is done by a spraying process which takes 15 minutes per truck. The shop has a stall capacity for 120 complete overhaul jobs at once.

A part of this space is assigned to passenger cars and a part to trucks. Motorcycles also have their respective space. On arrival at the shops, a vehicle is carefully inspected by an officer, who determines what the nature of the repairs to be done will be. The truck is then ticketed and sent in to be washed and then assigned to its stall.

A crew of men disassemble the truck; in the case of the complete overhaul the mechanism is taken to pieces until nothing remains but the bare frame. The various brackets and fastenings of the frame are inspected, loose rivets cut out and re-driven to make them absolutely solid and tight once more, and the process of reassembly is then ready to begin.

Meanwhile the units as fast as removed from the truck were ticketed with truck number and sent to the respective bays in the great shop where such units are handled.

The engine, for instance, goes to a special disassembling

shop, and is given a bath in hot soda to cut the oil and grease from it, and is then rapidly taken to pieces, and passes before skilled inspectors, who examine the condition of each piece and card it with the work to be done.

These pieces then pass to machines whose sole function is to perform the one operation required—crankshaft grinders for the shaft grinding, cylinders for re-boring cylinders, piston grinders for handling pistons. On completion of the work according to ticket, the parts once more pass over the inspecting benches, where the quality of the work done is carefully inspected and verified, and if need be, sent back for readjustment.

If acceptable, they pass to the reassembly bench just beyond. Thus in a few hours' time every part of the engine which is subject to wear receives mechanical treatment which brings it into as perfect condition as when originally manufactured.

The original makers employ the same tools that are used in this army shop for repairing and refinishing. When the engine has been reassembled, it is put on the stand and driven by belt power for some hours to smooth the bearings and make the working parts run quietly. It is then removed to a testing stand, where it is given gas and run under its own power against a dynamometer, and is not released from this stand until it generates the required amount of power for an engine of its class.

There is no guesswork about this part of the job. Every engine must deliver its quota and run absolutely sweet and true before release. While this work is being done on the engine, the transmission is also receiving similar treatment

and one of the warehouses to the left of it. A group of motor trucks can be seen at the right

## Camp Holabird—Largest Truck Overhaul Depot

*The crating room with 22 roller ways and a capacity for tearing down, crating and shipping a truck per way in 1 hour and 35 minutes*

*Showing the individual electric traveling crane used at each way. The crane in the illustration is lowering the floor of the crate, which is so arranged that almost all of the parts taken off the truck fit conveniently and compactly*

*Beginning the work of disassembling the truck. Showing the individual roller doors at the side of the building and leading individually to the disassembling stalls. The floor of the crate with many units distributed over it. Each unit is painted with oil, either by spray or brush, to insure against rust, which is often caused by the ocean atmosphere*

*View of many parts properly placed on the floor of the crate, and the frame and engine being lowered by the crane. The wheels are laid over the frame and the sides and tops of the crate are placed in position and securely fastened and the crate is then ready for shipment overseas*

*The chassis bays in the overhaul building where trucks in service on this side and intended for service overseas are disassembled and overhauled when necessary*

*Showing a part of the cantonment, a field, the band stand and the auditorium in which enlisted men are given instructions and special motor mechanics trained, and also serves entertainment purposes*

in a separate bay; the axles and differentials are receiving treatment in an adjacent bay; and every minor part of the vehicle—magneto, carburetor, radiator, steering gear, even the siren—is repaired by men who do nothing else, and know the last word in tuning up their respective units.

In due course of time the units travel, by a telfer or overhead crane, to the bay where the original frame stands, repaired and ready to receive them. In the case of standardized vehicles, every unit drops into its place without interference or loss of time. Where a conglomerate mass of different types of vehicles is to be repaired, there is naturally a tremendous slow-down in the rate of repair.

The amount of time required to take a truck to pieces completely and reassemble it, substituting already repaired units in case some particular part of the truck would otherwise delay re-erection, is approximately 4 working days.

Thus, with 120 stalls fully occupied, there should come out of the factory at least 30 completely rebuilt jobs daily, working one shift. Where the kind of repairs is less serious than completely rebuilding, the number would be proportionately increased. In ordinary work the shop would normally probably handle 50 or 60 jobs per day, but under pressure and with double shifts the number could be increased to 100 jobs, of which about 50 would be complete overhauls.

Thus it is seen that this shop is really a tremendous manufacturing institution, a specialized factory devoted to doing that kind of repairing which the operation of a large fleet of motor vehicles requires. The experiences of Mexico and France have taught the Army that maintenance is the key to success. A truck literally eats parts, as a mule eats hay and oats.

The personnel of the shop required is 55 officers and 1402 men. As a matter of practice the personnel may be more numerous, as it has been necessary to have a considerable number of men in training.

The warehouse buildings, 800 by 200 ft., like the other factory structures, are composed of steel, glass and concrete. The buildings are divided into sections, one section containing those spare parts for domestic use and the other those for overseas duty.

#### Crate 22 Trucks an Hour

The most remarkable feature of the plant is the crating department, including complete carpenter shops which manufacture the crates from raw lumber materials, making them in six pieces. A huge electrical traveling crane picks up the floor of the crate and deposits it on one of the 22 roller ways in the crating room, which is 800 by 200 ft.

This room is so constructed that it contains 22 ways for 22 trucks which enter through individual rolling doors along one wall on their own power, standing before the way along the wall. Two other electric cranes operate in addition to the crane that carries in the crate.

As quickly as the truck is run through the door and before its way the crew of mechanics start their work of disassembling and laying the parts in their proper position on the floor of the crate, which is conveniently arranged on the roller ways directly in front of the truck.

The body is loosened, lifted and whirled away to a distant corner of the shop by a crane, where it is torn down and crated in a flat package. An electrical traveling crane is operated above each way and picks off the heavier pieces of the truck and deposits them on the crate floor. The truck is completely disassembled until nothing is left but the frame containing the engine, and all of the parts are so conveniently distributed over the floor of the crate that the frame and engine can be laid on top compactly, and over them are placed the wheels. When the truck is completely disassembled and crated a third crane picks it up and carries it to the far end of the building through a huge door and into the waiting freight cars. The complete operation of running in a truck, disassembling, crating and loading occupies 1 hour and 35 minutes.

#### Crating Time Cut Three-Fourths

The truck completely crated consumes 370 cu. ft. of space. It is said that the crating operation is done in one-fourth of the time formerly used by motor truck makers, and that

the crate, which is 18 ft. long, 40 in. high and 40 in. wide, is one-fourth as large as the motor truck crates used by the manufacturers, and which occupy 1200 cu. ft.

All of the automobile truck and passenger car makers, it was stated, are sending their representatives to learn this crating method. Prior to closing the crate, all parts are painted with a solution of vaseline and lubricating oil, part of this operation being performed by a spray and the remainder with pail and brush.

The carpenter shop has turned out an average of more than 100 crates daily. It can manufacture many more than this, but is limited by the consumption of the crating room. The crate shop is an absolutely unique institution and cost \$500,000. It was so designed that following the war, when crating is no longer necessary, the building and machinery can be used for body building and body repairing, and it will use the complete camp outfit, making one repair shop for repair and construction of chassis and the other for construction and repair of wooden bodies.

Camp Holabird, which is exclusively a motor transport base, will be the distributing point of motor trucks for the United States Army for all territories. It is planned as a permanent institution. It is responsible for the maintenance and repair of all Army motor vehicles in the United States, which include 40,000 trucks, 10,000 passenger cars, 15,000 motorcycles and bicycles and 6000 ambulances. All heavy repairs, reconstruction and salvage are taken care of by the repair shop unit. Only minor repairs are made by local repair shops or commercial garages. The motor trucks are sent to the overhaul shop only when major repairs are to be made, which local service stations are unable to handle. About 40 per cent of the vehicles coming to the shop require rebuilding.

The need for so complicated a repair and construction institution as Camp Holabird was caused by the use of more than 100 types of vehicles by the American Expeditionary Forces.

Besides the mechanical work, Camp Holabird is also a very large center for motor transport activities. It is the headquarters for the district motor transport officer who administers the entire northeastern district of the county. It is an organization park at which motor transport personnel is received, organized, trained and equipped. It is a supply depot for motor transportation. It is expected that the camp will continue during peace times in the training of men for motor transport, and it will serve in the future as a necessary storehouse for motor repair parts and supplies for the Army in times of peace. Its fireproof warehouses are capable of storing millions of dollars' worth of parts and tools.

The camp has not neglected the social aspect. It has 7000 soldiers housed in cantonments which constitute a veritable city, and which has been supplied with pure water, sewerage, electric lights, streets, sidewalks, hospitals, bakeries, kitchens, bathing facilities, and lastly a huge auditorium where the men are entertained and instructed. There are also ball grounds, recreation grounds and the Y. M. C. A. hut. The camp has a band of 40 pieces which leads the men to their meals and also affords considerable entertainment in hours of relaxation.

Fokker Triplane

This is the type of machine flown by the late Captain von Richthofen

# The Use of Measuring Wires

## Permits of Accurately Determining the Effective Diameter of Screw Threads— Much Used in Inspecting Plug Thread Gages—Precautions Necessary in the Use of the Wires

FOR some time extensive use has been made of measuring wires for making accurate measurements of the effective diameters of screw threads, and wires for this purpose, which necessarily must be very accurate in dimensions and straight, are now on the market. The effective diameter of a screw thread is the length of a line through and perpendicular to the screw axis measured between the points where the line cuts the slopes of the thread. The method of thus measuring the diameter and the principles involved were discussed in an A. S. M. E. paper by H. L. Van Keuren of the Bureau of Standards.

In measuring screws by the three-wire method, cylinders accurately ground and lapped to size and diameter are used. These wires or cylinders are inserted in the thread two on one side and one on the other. A measurement is then made directly over the tops of the wires by means of an outside micrometer or other suitable measuring device. From this measurement and from the size of the wire the effective diameter of the screw can be computed.

### Choice of Wires

In the choice of wires any size may be selected which will permit the wires to rest on the flanks of the thread and still project above the top of the thread. It is best, however, to choose wires of such a size that they touch the sides of the thread half-way down, or, in other words, at the mid-slope. In this case errors in the included angle of the thread have no effect on the measurement of an effective diameter. Moreover, the time spent in computations is greatly reduced. The best sizes of wire for various threads may be computed from the following approximate formula:

$$G = \frac{P}{2} \sec a$$

where  $G$  = diameter of wire, in.

$P$  = pitch in in.

$a$  =  $\frac{1}{2}$  included thread angle, deg.

For 60-deg. threads this formula reduces to

$$G = 0.5774 \times P$$

The following extracts are taken from specifications recently written by the Bureau of Standards for purchasing wires for measuring thread gages: "The wires used are to be of steel. The working surfaces are to be glass-hard and lapped to a high polish. The working surface should be about one inch in length and the wire should be provided with a suitable handle. The handle should be provided at one end with an eye or hole for the purpose of suspending the wire when measurements are taken. On one side of the handle, which is flattened, there should be marked the pitch for which the wire is to be used as the best-size wire and the diameter of the working end of the wire. The working ends of the wires should be round to within 0.00002 in. and they should be straight to 0.00002 in. over any  $\frac{1}{4}$ -in. interval. One set of wires should consist of three wires, which should be of the same diameter to within 0.00005 in. This common diameter should be within 0.0001 in. of the size corresponding to the best-size wire for the pitch with which the wire is to be used."

### Standardization of Wires

Before the wires can be used to measure effective diameters of threads it is necessary to know accurately their diameters. The wires should be standardized in a way which approximates, as nearly as possible, the conditions under which they are used. In order to accomplish this purpose the wires are standardized with a micrometer caliper by measur-

ing the wire when placed over a standard reference disk, the diameter of which is accurately known. The object of measuring the wire over a cylinder is to approximate the condition of pressure which is exerted upon the wire when it is placed in the screw thread. The micrometer to be used for this purpose should be one which has graduations to ten-thousandths of an inch and upon which hundred-thousandths of an inch can be estimated. This can be secured in one of the similar forms of small precision bench micrometers. Care should be taken to make sure that the micrometer measuring faces are sufficiently parallel. If the wires differ appreciably in diameter, the two having diameters most nearly equal should be used on one side of the thread and the other wire should be used on the opposite side. In the computations the mean diameters of the three wires may then be safely used.

### Computation of Effective Diameter

In the computation of the effective diameters of thread gages, if the exact conditions are recognized the formula is quite complicated and the resulting computations are very laborious. The formulæ for computing effective diameters as given in most engineering handbooks involve the use of best-size wire and do not take into account the complications introduced when considering the effects of the helix angle of the thread. These formulæ, as generally given, result in securing an answer which should check with the outside or full diameter of the screw being measured. The effective diameter is not mentioned in these formulæ and this often leads to confusion. Reference will therefore be made here to a simplified formula for 60-deg. threads which results in the direct computation of the effective diameter. This formula is as follows:

$$E = M + \frac{0.8660}{N} - 3G$$

where  $E$  = effective diameter

$M$  = measurement over the wires

$N$  = number of threads per inch

$G$  = diameter of wires.

In the use of this formula the term  $0.8660/N$  may be computed for various pitches and the computations simplified.

The general formula which may be used for any size of wire which will fit in the thread and which takes into account the helix angle of the thread for precision measurements is as follows:

$$E = M + \frac{\cot a}{2N} - G(1 + \sqrt{\csc^2 a + s^2 \cot^2 a})$$

where  $a$  =  $\frac{1}{2}$  the included angle of thread

$G$  = diameter of the wires

$s$  = tangent of the helix angle.

The above formula involves squares and a square root of functions and therefore is awkward for making computations, and the following formula, which is an expanded approximation but which is accurate to better than one hundred-thousandths of an inch, is more convenient:

$$E = M + \frac{\cot a}{2N} - G(1 + \csc a + \frac{s^2}{2} \cos a \cot a)$$

This formula is a general approximation which may be used for U. S. form 60-deg. threads, Whitworth 55-deg. threads, Lowenherz 53-deg. 8-min. threads, and for other threads of a similar nature. It should be noted that the error due to

# "The Automobile After the War"

## Views and Suggestions of Georges Cote to Automobile Manufacturers of France as to Means and Methods of Meeting Reconstruction Problems and Foreign Competition

Reviewed by N. S. Diamant, Harrison Radiator Corporation, Lockport, N. Y.

**T**HE vital and all important problems of reconstruction have received the attention of engineers and industrial leaders in spite of the great and pressing needs of the war. Thus Georges Cote, director general of the Pilain Automobile Company of Lyons and Paris, in a book\* bearing the above title considers the problems of reconstruction and those having to do with successful competition by French automobile manufacturers with foreign makers.

In an introductory way attention is first called by Mr. Cote to the situation that will arise immediately after the declaration of peace; although the market will be flooded to a certain extent with military cars, the unfavorable reaction of this on the market condition will probably be limited, and, in any case, the situation will have to be met once only.

The real danger he considers to be the growth of American competition, which is already fairly large. Since 1913 the American danger began to be felt, and energetic measures of protection were requested by French manufacturers, in view of the obvious inclination of the public to become converted to American ideas, although the majority continued to patronize the sporty and aesthetic French cars. However, the war, with its great demands on equipment and production, made necessary the purchase and introduction of immense quantities of American products, and the public thus had occasion to appreciate American designs which for so long had been adversely criticised. The public judged them from a utilitarian point of view.

### War Has Popularized the Automobile

The transportation facilities that will be required in the invaded territories which have so savagely been ruined, and in the French colonies, can be met only by the assistance of the automobile and the truck. Particularly, when it is remembered that the rolling stock of the railroads has deteriorated so much in meeting war conditions. Finally, the war seems to have popularized the automobile so much that we can say the latter has become part of our life and customs.

Thus the manufacturers of France should not count so much on "universal reputation" to produce the best quality car as they have done in the past, but rather give to the purchaser a reasonable-priced, useful car.

According to Mr. Cote, the "dominant characteristics" of the utility car are the following: 1. It must be easy to drive and relatively free from deterioration of the most important parts even in the hands of the inexperienced driver. 2. Its operating cost must be low. 3. It must be capable of use even on very bad roads. 4. The price of the car must be as low as possible.

The author calls attention to the dominant characteristics which made the success of the Ford car possible, and thinks that these are its ease of control and minimum deterioration of the engine even in the hands of an inexperienced driver. In this connection he thinks that the present day common method of speed changing is one of the glaring defects of cars, inasmuch as it involves a rather skillful combination and manipulation of a hand lever with a pedal. Unless this is properly done the machine suffers considerably and some of the most essential parts rapidly deteriorate. With reference to the above, the question of two or three speeds is raised, and the opinion expressed that unless the car is light in weight and the engine fairly powerful, which is the case with the Ford, two speeds can hardly be considered sufficient.

### Two Devices for Changing Speed

In this connection Mr. Cote briefly describes two patented devices for changing speed, one of which is electromagnetic, and he calls special attention to the great desirability of using the engine itself not only for propelling purposes, but for braking as well. He calls attention to what he considers the most wonderful experience he has had with the above electromagnetic system, with which, while a car was going down hill, the control lever was placed on "reverse" and without the use of brakes at all the car was slowly stopped and reversed without the least shock or jar. Mr. Cote simply gives these general ideas and leaves it to the specialists to go into these matters deeply and carefully.

The author emphasizes the importance of a "flexible" car and cites American practice as a fine example, which French manufacturers could well afford to follow, and if necessary pay less attention to the question of efficiency, which is considered so important on account of the high cost of gasoline in France.

Attention is called to the two-cycle engine, and the question is raised whether it may not be possible to improve its efficiency. Considering the susceptibility of this engine to great simplification and cheap construction, it is desirable to undertake research along this line.

### Front Axle Drive

Another idea emphasized by the author is that of front drive, which is very desirable for light-weight cars. The front drive is very rational and simplifies greatly the mechanical arrangement of the chassis. This arrangement makes possible better distribution of weight, allowing the front axle to carry more dead weight and relieve the rear axle, which carries most of the useful weight. Front drive also makes possible the advantage of front braking, which is preferable since the front wheels have a greater coefficient of adhesion. Finally, one might add the advantage of having a closed, quiet car with the passengers in the rear and the engine with its accessories in front.

\*"The Automobile After the War." by Georges Cote, Director General of the Société des Automobiles Pilain (Lyons-Paris), 125 pp. published and copyrighted by H. Dunod & E. Pinat, 47 Quai des Grands-Augustins, Paris, 1918.

The author continues and calls attention to the desirability of increasing the distance between the ground and the chassis and of the judicious reduction of weight, and he believes that an ordinary four passenger automobile should not weigh more than 1800 to 1600 pounds (or 600 to 700 kilograms).

#### Production

The author in this connection calls attention to the handicap of the manufacturers who had to follow "the whims of fashion." He thinks it would be very much better if a given company after incorporating all the qualities which answer the real needs of the majority of its customers would be able to put its production on an all the year round basis, and thus increase and facilitate its output greatly.

#### Standardization

On the basis of past experience he advocates the classification and standardization of self-propelled vehicles and suggests the following:

- Class 1. "Popular Car" selling at lowest possible price, and corresponding to the "Ford."
- Class 2. Semi luxe, which would correspond to the present day 12-hp. (French) cars.
- Class 3. The car "de luxe," which should be built in three types, namely, for city, tourist and sport purposes.
- Class 4. A small rapid delivery truck good for useful loads of about 2600 pounds or 1200 kilos.
- Class 5. A heavy truck which can be built in capacities of two and four metric tons (4400-8800 pounds).

Standardization of this kind would benefit the industry enormously.

#### Possible Forms of Co-operation

Mr. Cote suggests and advises forms of co-operation between different manufacturers, by either organizing a syndicate or merging a number of firms. He suggests that the different firms in the industry decide to specialize in one of the classifications already given and form a strong association, the returns of each being made proportional to the capital invested. He favors an independent association, and not the absorption of smaller companies by larger ones.

The second form suggested is that of a "syndicate," among the advantages of which would be the distribution from a central organization of all the raw materials and tools which are to be used by the different members. This would result in considerable economy. Furthermore, besides a central purchasing office the syndicate might have some kind of a central office for inventions to which all inventors could submit any designs and plans of interest to the automobile industry. A special organization of this kind would greatly facilitate the testing of new schemes, and demonstrate their practical feasibility. The author thinks a "syndicate" would present all the advantages of "combination," conserving at the same time the independence of each member, whereas "fusion and merging," if generalized might pave the way to a "trust," and thus would become incompatible with democratic and individualistic ideas.

#### Labor

Under this heading the author calls attention to the generalization of labor saving devices and the increasing substitution of machines for men. In this connection he approves and speaks highly of American methods of specialization and selection.

The following interesting figures are given to show the great possibilities of expansion of the automobile trade

in France and its colonies. The increase of automobiles, including trucks, in France was as follows:

7,183 vehicles from 1908 to 1909
8,900 vehicles from 1909 to 1910
10,540 vehicles from 1910 to 1911
12,562 vehicles from 1911 to 1912

In 1914 the total number of automobiles, including 6000 trucks, was about 100,000 and during the war there have been added 35,000 trucks and 10,000 small trucks, making a total of 145,000 for a population of 39,000,600; that is, one automobile for every 273 people. Without suggesting the possibility of equalling the figure reached in the United States, which according to 1916 statistics is one automobile for every 29 people, it would seem that there are great possibilities of increasing the number of automobiles in France. Further, considering the whole of Europe in order that it may have the same ratio of automobiles to population as that of the United States, the total number of automobiles of all types should be 15,583,000, instead of 437,600, representing an increase by 15,145,400. Going a step further and considering Africa, Asia and Australia, it will be found that on the same basis the total number of vehicles ought to be 56,000,000 instead of 4,500,000.

It is idle to base any economic studies on the latter figures, since it will not be possible for the world and even for Europe to have the same proportion of cars to population as America. However, the above figures do show that there is a great field which justifies the making of a special definite effort to increase the production. The logical consequence of increased production will be a complete revision of present commercial methods.

#### Actual Sales Methods

According to these the buyer gave his orders at not particularly attractive prices either to an agent or directly to the manufacturer, who in general could not fill this order immediately, but placed him on an indefinite waiting list. It was only the large companies which had "direct representatives" and service stations that could properly look after their customers. In short, the old methods did not offer any facilities to the buyer. The prices were rather high; also many cars were sold to men who owned one, and thus the manufacturers or agents had to take an old car back at their own risk. Further, the purchaser, being also a seller, became more exacting and hard to please. Thus the chief problem is to force automobiles among new buyers. To accomplish this two things are necessary—a reduction in price of all kinds of cars except the strictly de luxe type, and the provision of every possible service facility to the purchaser.

#### Price Reduction

Reference to this matter has been made before and considerable emphasis laid upon it. According to Mr. Cote, the selling price should differ as little as possible from the actual cost of production. The difference between these two items represents general sales expenses, agent's commission and the net profit of the manufacturer. The numerous facilities that ought to be given to the customer should be charged to the general item of sales and be given considerable importance; this situation should be accepted with all its consequences, and it will be found very profitable both to the manufacturer and to the agent.

#### Facilities to Be Offered to the Purchaser

According to the above the commission will represent a fair profit and the cost of efforts to attract prospective buyers and retain them. This can be done by means of  
(Continued on page 1075)

# Cultivating Japanese Automotive Field

## PART V

### Domestic Manufacture of Tires—Opportunities for American Tire Makers— Accessory Market Is Limited—Suggestions to American Manufacturers—Conditions Not Favorable to Tractors

By Tom O. Jones\*

AT the present time there is no established preference respecting tire types in Japan. American cars imported are adapted to both clincher and straight-side construction. Since two of the largest American tire companies are now represented in the country, one by a branch house and the other by a distributor, practically any size tire can be secured in either hard or soft bead.

The bulk of the replacement business in Japan falls to the Dunlop Co. This is a separate corporation with both British and Japanese capital interested, but is allied with the British company of the same name. A large factory is maintained at Kobe, where the production is confined entirely to soft-bead tires.

This factory, which has been in operation for several years, manufactures not only tires but many other lines of rubber goods. Its business is not limited to Japan, but extends to various parts of the Far East, practically all the eastern business of the British parent company being turned over to the Japanese factory, so that its trade reaches as far south as Singapore. The factory is well equipped and according to the management, the workers are easily trained and soon become highly proficient in the work. Social work is carried on for the employees, with separate departments for men and women, in which there are lunch rooms, libraries, and games.

In value, the tire business done for jinrikishas exceeds that for motor cars. This can readily be understood when one considers the great number of jinrikishas that are used, not only in Japan and China but also in the Straits Settlements, and practically all of these jinrikishas are equipped with pneumatic tires.

Within the past year one of the largest American rubber companies has completed a plan of organization whereby it will operate a factory in Japan. A foreign organization entering the Japanese field will be materially assisted by having Japanese capital in-

terested, and this is the plan adopted by the first American company to enter rubber manufacture in the Empire, a close alliance having been established with a large manufacturing concern. In the beginning practically all the manufacture will be mechanical rubber goods. When the plan was consummated last fall it was hardly expected that manufacture of tires could be undertaken in less than four or five years.

There are several Japanese rubber companies that import raw material from the rubber plantations of Malasia. In fact, Japanese capital controls a number of large plantations. But these companies all operate on a small scale, and for the present at least will have very little influence on the volume of American trade.

#### Selling Agencies for Tires

It is advisable for an American tire company entering this field to do business through one house, unless the company feels disposed to open its own offices and send its own representative to the

field. This latter proposition doubtless would have small appeal, because of the expense involved in conducting the organization and introducing the lines for the very small volume of business which can be expected when the company is only to get its share of the tire sales for less than 3000 automobiles. Japanese dealers handling tires are accustomed to the British plan of operation, that is, paying for the tires as they are sold and having the stock kept up by the tire companies.

Below is a table of prices prevailing in Japan last fall for one of the standard American tires, the quotations being for clincher-type fabric casings and tubes (yen=\$0.498):

Size in Inches	Smooth or Nonskid. Yen	Tube. Yen	Size in Inches	Smooth or Nonskid. Yen	Tube. Yen
30 by 3.....	47.50	12.20	35 by 4.....	91.00	18.50
30 by 3½.....	63.20	14.20	36 by 4.....	94.00	18.75
31 by 3½.....	65.50	15.10	33 by 4½.....	112.00	20.45
32 by 3½.....	68.00	15.30	34 by 4½.....	115.00	21.30
34 by 3½.....	72.00	16.20	35 by 4½.....	118.00	22.20
31 by 4.....	80.50	16.75	36 by 4½.....	122.00	23.00
33 by 4.....	86.00	17.60	34 by 5.....	140.00	27.00
34 by 4.....	89.00	17.90	35 by 5.....	146.00	28.00

\*EDITOR'S NOTE—Mr. Jones was formerly with the J. B. Crockett Co., New York, and was given a special appointment by the Bureau of Foreign and Domestic Commerce to investigate automotive conditions in Japan, China, the Philippines and Hawaii. This story is taken from the advance proof sheets of Mr. Jones' report to his department.

The market for additional equipment or attachments for cars shipped from America is a small one. As a general rule, the Japanese buyer is disposed to take the car as it comes without extra equipment. Americans in the automobile business generally agree that the fewer equipment features the more disposed the Japanese are to favorably consider the car. This, of course, is not meant to exclude the usual standard equipment of a car, such as speedometer, windshield, top, etc. Shock absorbers, for instance, find little or no market. Surface conditions of the roads are generally good, and the ordinary spring equipment, with perhaps an extra leaf inserted, gives satisfactory riding comfort.

An accessory demanded in Japan, but not usually found on the American car at the present time, is a bulb horn. This is required by the police regulations. Such horns are now being made in quantities in Japan to meet the demand, as are door fittings, foot and robe rails, and other features which generally enter into the home-built closed bodies.

Accessories are generally handled by the firms which have car representations. Just how little demand there is, and how little effort is expended on the sale of accessories, was revealed one afternoon in a call on one of the largest dealers in Tokyo. About half a store front was given up to the accessory department. Articles were displayed in the windows and in cases around the room, but to get into the salesroom it was necessary to obtain the key from the manager. In other words, there was not enough business in this line to warrant keeping a salesman in that room. The stock carried was similar to that usually found in a small garage in an American city, and included only essential parts, such as spark plugs, carbureters, bulb horns, and acetylene gas generators.

#### Some Suggestions to American Manufacturers

One accessory which might be introduced in Japan is a light dimmer or nonglare lens. At the present time there are no regulations for lights, either in city or country. For the large variety of American extras there is practically no market in Japan, certainly not enough to warrant getting after the business in any way except by correspondence.

In many ways Japanese dealers, at least large firms, are progressive. As an instance of this the action of one of the companies during the season of 1917 is worthy of mention. This firm, which has exclusive selling rights for one of the best-known low-priced American cars, foresaw the possibility of an absolute embargo against the export of American cars after the United States entered the war, or if not absolute prohibition at least insurmountable obstacles that would make shipping even more difficult than it had been up to that time. Accordingly orders were placed for hundreds of cars to be shipped as promptly as possible. These began to arrive in July and followed in quantities for two or three months. Shipping conditions continued to grow worse, but this dealer had on hand plenty of cars for immediate delivery at a time when cars were greatly desired in Japan. After all, the way to get business in Japan is to be able to make immediate deliveries, and this dealer had shown wisdom in following the course he did.

Another company, having decided to take the representation of American cars as a separate division of its established business, ordered 39 cars of different makes by cable as its first samples and devoted practically all of the two lower floors of an extensive

building in the very best business portion of Tokyo to the automobile sales. At the suggestion of the writer, this company inaugurated the business with some advertising that has had very little trial in Japan, namely, the mailing of personal announcements. As the firm had been in business for several years and had a large number of names on its books, and the family connections of the principal stockholders were extensive, a good mailing list was available. According to the sales manager of the firm, results were highly satisfactory, numerous prospective customers being secured even before the sample cars had arrived.

#### Should Avoid Demanding Too Much Business

The American manufacturer should studiously avoid, in his first correspondence with a Japanese dealer, to scare the prospective distributor at the very start by demanding too much business the first year. As an instance in point, a manufacturer, in reply to a dealer's inquiry, said that he believed the Japanese market should be good for 100 cars the first year. The Japanese dealer immediately gained the impression that the manufacturer was trying to make him guarantee to take 100 cars during his first season. He was new to the automobile business and was not in position to guarantee any such amount of business. The writer, feeling that this would be a good connection for the American manufacturer, took it upon himself to assure the dealer that the company would not be arbitrary on this point, and on the strength of this assurance the dealer cabled an order for six sample cars. In less than two months another order was sent for 24 cars, and the Japanese firm seemed to be well on the way to take the suggested number of cars during the first year, but the one suggestion in the first letter almost halted the deal. No doubt the matter could have been straightened out by mail, but it would have meant the delay of three months in getting the business started.

It is well, therefore, in first letters to disregard any suggestions as to the number of cars that should be taken, leaving this with the dealer, or if the question is brought up, care should be taken to let him know that he is not required to take a large number of cars. To a certain extent this may seem contrary to American sales methods, but its wisdom can be found in the fact that the company which is now getting more business in Japan than any other American concern specified a very small number of cars in its first contract and continued with this dealer even though this specified number was not taken the first year.

#### Must Guard Against Conflicting Lines

Another point which should have the careful attention of every export manager is the matter of conflicting lines. There is one company in Japan which for several years has had the sole selling rights for a low-priced American car. Within the past year it has taken on another line which is in direct competition, there being hardly \$100 difference in the price of the two cars. One cannot help but feel that the first car is not getting the representation it should. The manufacturer should know just what cars are being handled by an agent and he should refuse to make a contract when a conflicting line is handled. There is no telling when or on what line "sidetracking" may take place.

A determined effort should be made to live up to all promises made to the dealer. Rash promises are more often made by traveling representatives than in correspondence from the factory, for the traveler is desirous of getting business and is likely to make promises that cannot be fulfilled. The chief complaint along

this line is in the matter of deliveries. Delays, of course, are often caused by circumstances over which neither the traveling man nor the manufacturer have control, but the dealer loses sight of this altogether, and simply feels that he has been promised something which the company has not delivered. The same applies to promises on services, catalogs, and other printed matter. Delays result in a feeling on the part of the dealer that is not to the best interests of the manufacturer.

### Better Packing Suggested

Dealers in Japan are generally satisfied with the cars that the American manufacturers are sending them and with the financial terms. There is little protest on the packing, but there is still room for improvement along this line. Cases have arrived badly broken and cars damaged, but there has been vast improvement in packing during the last few years. Heavy packing cases are well worth the extra cost. During the summer of 1917 a shipment of cars, the list price of which in America is more than \$1,500, was received in Yokohama. Upon opening these the enamel work on fenders and hood was found to be badly cracked. It looked very much as though these parts had been fitted while still "green." There are instances in which packing paper has stuck to and ruined the finish of the bodies. Certainly the cars should be given time to dry before they are boxed. Instances of this kind, however, are rare; they can easily be guarded against and are well worthy of attention by the manufacturer. When cars are boxed partially disassembled, great care should be exercised to have all parts included in the case.

A subject that has been written up so often that it seems a stereotype of every article on export trade is the matter of postage. It would seem by this time that foreign mail would have at least the necessary amount of stamps to carry it through, but a number of instances can be cited where this is not the case. One dealer, tired of paying excess postage time after time, adopted the policy of returning insufficiently stamped mail. Many important letters were sent back to the company, and there was much delay in the business. A card calling attention to this matter should have a place with "Do it now" and other placards over the mailing desk.

Improvement could be made in the form of the manufacturer's contracts. Contracts made for Japan and foreign trade in general should be made to cover every point, of course, but they could be made somewhat more brief. Most of them are formidable looking documents and contain a lot of conditions that never are and cannot be fulfilled.

During the past year considerable business has been built up in importing used cars into Japan. Honolulu dealers seem to have been the first to discover this plan of ridding their own territory of surplus second-hand cars. According to the Honolulu dealers who are engaged in this business, they have made efforts to ship out only cars that were in fair mechanical condition, endeavoring thereby to develop the trade and clear the field for new cars. Usually these cars are shipped on a blanket order which specifies a certain number of used cars totaling a certain value. That somebody is simply trying to unload junk is evident by some of the vehicles that can be seen on the docks at Yokohama. Honolulu dealers claim that these cars are sent from the Pacific coast. It is certain that unless there is a change this newly discovered outlet for used cars is going to be cut off even before it is fairly started, a circumstance which may be looked upon by the American manufacturer as either favorable or unfavorable.

### Use of Tractors Not Practicable

Although the available agricultural land in Japan is intensively cultivated and farming has a big part in the country's industry, there is absolutely no market for farm tractors worthy of consideration. Most of the landholders have small plots, probably more than 50 per cent of the farms being less than 2½ acres in extent.

Rice is of course the principal crop grown, and the manner of preparing the land is decidedly against the use of tractors. The fields are from 60 to 100 ft. square and terraced one plot above another, so that the water used in irrigating may drain from each terrace to the one lower. Moreover, the wages of farm laborers, if help outside the owner's family is required, is so low that the cost of gasoline at 45 cents or more per gallon would prohibit the use of tractors.

Road tractors and trailers also can be given little consideration. Roads are narrow and turns sharp, making almost impossible the handling of road trains.

## Refinements in Design to Facilitate Maintenance

By J. Willard Lord

**I**N the beginning of the industry the designing engineer dominated production engineering—this because every effort was made to build a car that would run. Then production engineering, because of competition, became more and more powerful and slowed up the efforts of the designing engineer to improve the product; which increased production and lowered selling prices.

There is, however, a third element of engineering. On any car built to-day there are one or more parts difficult to take apart because there never was any provision made to apply a puller or heavy wrench or other device which would make it possible to tear down in about the same time as to rebuild. We all know of jobs that can be assembled in twenty minutes but take four hours to get them apart when replacement is necessary, because no adequate means are provided or else the job is buried in the depths of the car, requiring considerable tearing down to get to it.

The neglect of this maintenance element helps run up repair time and charges and makes very difficult the maintenance and service problems, the satisfactory solution of

which are so essential to the sales organization and the number of sales made.

In other words, there are three elements of engineering that should bear on the product: 1, Design; 2, production; 3, maintenance.

The third item has not received sufficient attention and thought at headquarters or the factories, maintenance and service often being left to selling agents who are essentially salesmen and not engineers and mechanics.

When designing the "Post War Car" I hope to see

1. *Refinements in engineering*—A lighter, more staunch car, more efficient, roomier and more comfortable.

2. *Refinements in production*—More readily produced and easier to build accurately and hold to close limits. Good design and accuracy mean long life.

3. *Refinements in maintenance*—Adequate provision made to disassemble parts quickly when necessary, provision made to apply various kinds of pullers, wrenches, etc.; due consideration given to tools necessary to make good, quick and accurate repairs.

## HORSELESS AGE SUBSCRIBERS

Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## Readjustment

WE are now passing through the period of readjustment. When we meet friends we are wont to ask them what they think of conditions, and what this or that concern, which was heavily engaged in war work, is going to do. In some cases definite conclusions can be drawn while in others this is impossible.

One important fact, however, stands out very plainly, and that is that the period of readjustment is going to be short. It is like a yacht race. Before the starting gun is fired the yachts can only jockey about behind the starting line, but as soon as the starting signal is given they can pass the line and begin the race. Industry is now in the jockeying period. The clever skipper is the one who will put his boat across the line to a flying start, and he is the one who will be just that much ahead when the commercial race begins again.

The war has stimulated business competition. The principal reason for this is that it has reduced prac-

tically all concerns in any given line of business to the same level. Old business connections have been done away with in a great many instances, and the office of the purchasing agent will again be the mecca for thousands of traveling salesmen who have busied themselves in the past few months answering letters begging for deliveries on materials ordered months before or turning down orders for future delivery. In other words, business is getting back to a normal state, and it is getting back fast.

The period of readjustment is going to be short, yet it is going to take a measurable length of time. It is easier to tear a house down than it is to build it up, and the same material cannot be used. It is easier to re-organize a business for war with the Government back of you with all the money you need than it is to get back to peace times. The jockeying time will be very short—and then for the commercial race!

## Anti-Friction Crankshaft Bearings

ALTHOUGH spasmodic attempts have been made in the past to fit anti-friction bearings to engine crankshafts, the practice has never gained much ground. These bearings are of the greatest advantage on high-speed shafts, and when even the axles of farm tractors are mounted on roller bearings it seems strange that their use on the crankshafts of high-speed engines should not have become popularized.

It is, of course, the general opinion that anti-friction bearings are used because they reduce friction and thus prevent waste of power. This certainly is one of the reasons why they are preferred to plain bearings in many classes of work. But it is to be doubted that they would ever have attained their great popularity in the automotive field if it hadn't been for the fact that they require practically no attention. Just a slight amount of oil applied at long intervals, sufficient to maintain a film over the bright metal surfaces and protect them from rust is all that is required. A plain bearing, on the other hand, must be constantly kept well lubricated or it will soon wear out and give trouble. Therefore, where it is difficult to insure a constant supply of oil to the bearing it is advantageous to use an anti-friction bearing which does not need it.

In an automobile engine having a completely closed crankcase, and where the lubrication of the cylinders is effected by means of the splash or spray of oil in the case, the lubrication of the crankshaft bearings is easily taken care of. The ordinary circulating splash system is simplicity itself, and even if the bearings required no lubrication, all of its elements would have to be provided to take care of cylinder lubrication. Therefore, the use of ball bearings on the crankshaft would not reduce the amount of attention that must be given to crankcase lubrication.

Another reason why anti-friction bearings are not used is the difficulties connected with mounting them on the crankpins and intermediate journals. The

bearings must either be stripped over the crank arms, which necessitates the use of bearings of very large size, together with split filling rings or bushings, or the crankshaft must be built up. Both of these constructions are rather expensive. At the present time ball or roller bearings are used only on engines with only one or two main bearings, in which the mounting difficulty does not arise.

In single and double-cylinder engines roller bearings are occasionally used on the crankpins. Where the crankpin is a separate piece it can readily be hardened and ground and the rolls can bear directly on it, so that the outside diameter of the bearing is not appreciably increased. But if a ball or roller bearing had to be stripped over the crank arms it would have to be of large size, which not only would increase the necessary size of the crankcase and add to its weight, but also add to the centrifugal mass, thus increasing the bearing loads.

It is thus seen that the fitting of anti-friction bearings to multi-throw crankshafts is hedged about with difficulties, and though the reduction in frictional losses which their use would insure would be desirable, the consensus of opinion among automotive engineers is that it does not warrant the expense involved.

## Double vs. Single Valves

A GOOD deal of valuable research work has been done at scientific laboratories in this country in regard to problems arising in connection with war work. While the war lasted it would have been poor policy to publish the results obtained, but now that it is over we may expect to see considerable material of value to the engineering fraternity released.

In another part of this issue we reprint a part of a report on an investigation of the subject of air flow through poppet valves. This problem arises in the design of explosion engines, and especially of aircraft engines, when the relative advantages of a single large diameter and two smaller valves are considered. So far we have considered the flow to be proportional, under a given head, to the actual area of valve opening. It has generally been admitted that a very narrow annular opening, such as obtained with a large diameter and small lift, would not be quite equal to an opening of equal area obtained by the use of a smaller diameter valve of greater lift, but just how much effect the form of the opening had on the flow has been conjectural.

While the investigation referred to was made under the condition of steady flow, instead of under interrupted flow as obtains in a combustion engine, we are fairly safe in assuming that the results obtained are indicative of what may be expected in an engine. They have definitely shown that a relatively high lift is a great aid in obtaining high volumetric efficiency. Heretofore it was generally assumed that a lift equal to one-quarter the valve port bore, giving a valve opening equal to the valve port area, did not restrict the flow of air in any way. The investigation showed that with a lift equal to one-

quarter the valve diameter the flow is less than 67 per cent of what it would be if the valve were entirely removed, and with a lift equal to one-half the diameter it is equal to between 80 and 90 per cent of the flow through the unobstructed port. Evidently it requires an infinite lift to give a flow equal to that through the unobstructed port and with any moderate lift there is a reduction of the flow.

A relation that has been definitely established is that with the lift proportional to the diameter the flow through a valve is proportional to the square of the diameter, or, in other words, to the area of the valve port. On the other hand, with a constant lift not exceeding one-quarter the port diameter, the flow varies only about as the  $4/3$  power of the port diameter. It is under this condition, that is if the lift can be maintained constant, that double valves are of the greatest advantage over a single valve.

## War Truck Repair Shops

THE war has resulted in the building of a number of immense automobile repair plants, and now that hostilities have ceased some of these will be of very little use. This seems to apply particularly to a partly completed repair works at Slough in England. Most of the plants at which the British transport vehicles were kept in repair were located not so very far behind the lines in France, but last spring when the Germans made their great drive and advanced to within a few miles of Amiens, these repair depots were seriously threatened, and to provide for all possibilities it was decided to erect a large plant in England. An idea of the immensity of the proposed plant may be gained when it is stated that the plans called for an area of no less than 15 acres under roof.

When the tide of the German advance was turned and it became apparent that the plant would not really be required, its erection became a matter of some concern to British automobile and truck manufacturers, and their anxieties are voiced in an article in a leading engineering paper. Should the Government complete the works about the only use it would have for them, now that the war is over, would be in the repair of the thousands of war-worn military trucks and automobiles. The automobile manufacturers, on the other hand, feel that during the early reconstruction period they cannot immediately get back to 100 per cent peace time production, and if they could secure the business of rebuilding or overhauling the war trucks it would serve to help tide them over this period of readjustment. Therefore they are urging that the Slough project should be dropped.

GREAT inroads have been made on the timber supplies of the leading European countries during the past four years and as a result wood construction will undoubtedly be more and more replaced by metal construction. In Great Britain about one-half of the forests were cut down during the war.

## England Sees Certain Development of Commercial Aviation

Plans Already Being Made for Mail, Express and Passenger Transportation Over Routes from London to Scotland, France, Ireland, Russia, Africa, India and Australia—Problems of Laws Being Considered

By David Beecroft\*

LONDON, Nov. 25—(Special to AUTOMOTIVE INDUSTRIES)—Post-war aircraft activities are taking more definite form since the signing of the armistice and it is now generally conceded that commercial aviation is certain to make very rapid progress.

A report was made some time ago by a committee known as the Civil Aerial Transport Committee, and the presentation of this report to Parliament this week has opened the door for a few of its broader considerations, although the complete report has not yet been published.

The committee has six definite conclusions regarding commercial aviation, which include a business flying speed of 100 m.p.h., stages of 500 miles or thereabouts as the ideal distance for limits of flight, arranging facilities for night flying, and providing of both land and air brakes to meet landing conditions.

The six conclusions of the committee are:

- (1) That for commercial success speed is probably the most material factor.
- (2) That for commercial success the speed needed depends very largely on the conditions of competing methods. Between large centers connected by direct high speed railways, speeds of 100 miles per hour are desirable; but for linking places between which the railway service is slow or interrupted by sea crossings, lower speeds will be found commercially practicable.
- (3) That at present stages of about 500 miles would be the normal limit, but that it will be desirable from the commercial point of view that stages should be as long as possible.
- (4) That it is desirable as speedily as possible to develop the existing facilities for night flying, especially for the carriage of mails.
- (5) That heavy loading is necessary for commercial success, but since this will involve a high landing speed, development of land and air brakes is necessary.
- (6) That in view of certain disadvantages of high landing speed, efforts should be made to keep loading as low as possible consistent with securing a commercial rate of speed, and to provide for aerodromes and landing places possessing the best possible surfaces, and that it may well be hoped that future inventions and improvements in design will enable a lower landing speed to be attained without sacrifice of flying speed.

The door is just opening on the possi-

bilities of commercial aviation, and no one to-day can foresee the widening future that awaits it. Up to the present invention has largely had to do with war development, but from this date forward the needs of peace and commerce will be the spurs to invention.

It is generally recognized that the large capacity planes are to be the leaders in commerce and that the possible field of commercial aviation embraces—

a—An express letter mail which will compete in speed with telegraph service and constitute a new aspect of postal service.

b—Passenger service that will afford very high sustained speeds over long distances, particularly where water routes are included.

c—Carrying of such ordinary merchandise as commercial samples which otherwise would require a long time for transporting.

Undoubtedly the light machines with capacity for one or two passengers will furnish the immediate call for passenger service, and following such service will be the installation of large machines for scheduled service.

The recent performance of the monster Handley-Page carrying forty passengers over the City of London is a suggestion of what may be in store in the near future. Such a machine with its four engines, giving a total of 1400 horsepower and with its wing spread of 137 ft. and a sustained speed of over 100 m.p.h., is indicative of what invention will bring out.

The garaging of such an aerial monster is facilitated by the use of hinged wings which swing back parallel with the fuselage and give a very compact machine.

Innumerable problems are bound to arise with regard to the manifold tasks lying ahead, but already Great Britain has had committees working on them, and while nothing tangible has come out of the committee further than some resolutions, these convey some conception of what must be looked for.

The problem of aerodromes across the length and width of those sections of the country called for by aerial transporta-

tion is one of these. A committee working on this problem has concluded that the following points should be kept in mind with regard to location of aerodromes. Landing grounds should—

- (1) Bear some reference to the direction of the main aerial routes;
  - (2) Be sufficiently far from the centers of cities to be fairly clear of houses in the direction of flight;
  - (3) Be unlikely to be shut in by buildings in the immediate future;
  - (4) Be as far as possible clear of railways, telegraphs, trees, and other obstructions;
  - (5) Be situated on ground as far as possible free from mist or fogs;
  - (6) Be provided with adequate water supply, telephone connections, and good facilities for rail, tram, omnibus and motor traffic with the different districts of the cities to be visited;
  - (7) Be capable of expansion.
- The Second Committee also came to the conclusion that the use of aircraft would be advantageous:
- (1) In the case of mails, by competing with the telegraph service, or by establishing a new type of express letter service;
  - (2) In the case of passengers, by affording rapid transit over long distances, particularly where the journey includes a sea crossing; and
  - (3) By enabling ordinary merchandise, commercial samples, etc., to be carried more rapidly than by any other means.

(Continued on page 1073)

### Postpone S. A. E. Winter Meeting

NEW YORK, Dec. 16—The winter meeting of the Society of Automotive Engineers has been postponed. The new dates are Feb. 4 to 6 instead of Jan. 12 to 14. The Victory Dinner will be held at the Hotel Astor, Feb. 6. The change in dates has been made so that the meetings will be held during the New York automobile show, which is to be held in the Madison Square Garden and the Sixty-ninth Regiment Armory during the first two weeks of February.

### Sales of War Materials

WASHINGTON, Dec. 13—Secretary Baker emphasized yesterday that War Department plans for disposition of surplus stocks of raw materials contemplate the absorption of these stocks by the ordinary peace-time industries of the country in such a way as will prevent economic disturbance. In letting go of its considerable holdings of copper, steel, lead or similar products, Mr. Baker said, the War Department will consult both the producers and the consumers of these commodities.

### Soldiers in Aviation Service Discharged

WASHINGTON, Dec. 16—Thirteen thousand soldiers in the Division of Military Aeronautics, 30,000 engaged in spruce production, and 7000 in the Tank Corps are among the enlisted men designated for immediate discharge from the army, according to a statement made here to-day by General March.

\*David Beecroft, Directing Editor of AUTOMOTIVE INDUSTRIES, is at present in Europe as one of a party of Business Paper representatives, called to the other side by invitation of the Allied Governments.

## Goodyear Patent Is Not Infringed

**Firestone Does Not Infringe—  
Some Claims Invalid, Others  
Not Infringed**

NEW YORK, Dec. 18—Many of the claims of the Goodyear tire machine patent, over which the Goodyear Tire & Rubber Co. started suit against the Firestone Tire & Rubber Co. in 1914, have been declared invalid, and certain other claims alleged to be infringed are held not infringed. This decision, rendered last week by the United States Circuit Court of Appeals, reverses the opinion of Judge Killets when in May, 1916, he held the patents valid and infringed by Firestone. At that time, and pending final decision, Firestone was placed under a bond of \$225,000.

The decision is an important one, inasmuch as it covers what were alleged to be basic patents covering tire making machinery. Immediately following the earlier decision a very considerable number of companies acknowledged the apparent finality of the opinion and arranged with Goodyear to operate under the patents. These included such well-known makes as United States, Revere, Federal, Fisk, Empire, Howe, Kokomo, Mason, General (Akron), Portage and others.

To quote a Goodyear official, the effect of the decision is that Goodyear is "temporarily licked"; it is intimated that the litigation may be carried further. It is possible for the case to be brought before the Supreme Court of the United States on a writ of certiorari.

The patents in suit were one issued to Seiberling and Stevens on June 14, 1904, No. 762,561, and one issued to Seiberling Nov. 30, 1909, No. 941,962, the latter issued upon application made by the State. In the original decision Judge Killets held valid and infringed claims 1, 2 and 14 of the earlier patents and sixteen claims of the later patent. Under the new decision claim 1 of the Seiberling-Stevens patent was held not infringed and claims 2 and 4 are held invalid for want of invention; claim 14 "does not differ from the second in any respect now material." Of the State patent claim 4 "and all other claims sued upon (except the 15, 17 and perhaps the 11)" are held invalid.

In the original suit the Goodyear company contended that the Seiberling-Stevens machine was the pioneer and that it paved the way for the modern semi-automatic tire making machine; that it was the first machine ever produced to make automobile tires, and that while the majority of the tire makers have been building their tires on machines licensed under the Goodyear patents, a few, among them the Firestone Co.,

refused to conceive the validity of the Goodyear patent. The purpose of the machine was to supplant the uncertain and inefficient results of hand work by stretching the fabric layers and uniformly placing them by machine processes.

Pending the appeal, all the exhibits were removed to the Federal Court at Cincinnati and the tire machines were set up side by side for the edification of the judges. During the argument of the case early in 1917 the full bench of judges viewed the manufacture of tire casings as carried on in the Goodyear and Firestone factories.

After the argument but before the court had rendered its opinion, Firestone discovered new evidence in the form of a Belgian patent of 1906 issued to a Frenchman named Mathern. The utilization of this patent was impracticable before this time because of the European war. The case was reported to consider the Belgian patent and its effect upon the State patent in suit. A replica of the Mathern machine, the original having been purchased by Firestone from Mathern in 1909, was set up beside the more modern machines and operated with them before the court.

### Makers Pay \$23,981,368 Taxes

WASHINGTON, Dec. 18—Automobile manufacturers paid the United States Government \$23,981,368.35 for the year ended June 30, 1918, under the 3 per cent revenue tax. Of this amount more than 60 per cent came from the State of Michigan, which paid \$14,711,373.33.

### General Motors Building Three Tractors

NEW YORK, Dec. 19—In addition to the 2-3 and 3-4 plow tractors brought out recently by the General Motors Corp., which were described briefly in AUTOMOTIVE INDUSTRIES of November 28, a third model, known as type D, is being introduced. Model D is a small tractor or motor-cultivator designed to operate existing horse-drawn farm implements of regular type. It will sell for \$450. It is understood that later on a complete range of especially designed and low-priced farm implements for model D will be marketed. Model M, the 2-3 plow type, is priced at \$650 and the larger model is \$900. Arrangements are being made to distribute these tractors on a basis of limited allocation to each State. About 10,000 tractors of the three models will be produced during the next four months by the new factory at Janesville, Wis.

### Col. Mars Heads Aircraft Production

WASHINGTON, Dec. 19—Lieut. Col. J. A. Mars has been appointed director of the Bureau of Aircraft Production, taking the place of W. G. Potter, who has resigned as was previously announced. Col. Mars is a regular army officer.

## Makers Slowly Quit War Work

**Efforts Turned Toward Re-  
building Sales Organization  
—Truck Makers Active**

DETROIT, Dec. 17—Manufacturers in this district are congratulating themselves or otherwise, depending on their ability to get out of war work and back into their customary peace lines. Shell contracts and other ordnance work is not being cancelled as rapidly as the work for the Bureau of Aircraft Production. Quartermasters' supplies are also being manufactured with scarcely any sign of a decrease.

While finishing up the odds and ends of war contracts, manufacturers are seriously engaged in an endeavor to rebuild their somewhat shattered sales organizations. Service departments of dealers have been hit even harder than sales departments, and to get both back on a somewhat normal basis is proving a tremendous task. The report which seems to have circulated in some localities that dealers throughout the country are overstocked is discounted here. Both in the high-priced and low-priced lines it is stated that dealers have not enough cars to meet demands, even though that demand is below normal.

Manufacturers like Cadillac and Dodge, whose plants were undisturbed by war work because the Government took their commercial product practically as it stood, are in a fortunate position. There are quite a few others who are also able to turn their plants directly into peace work without an internal reorganization. The plants in this situation are simply going ahead with their pre-war plans as if they had never been interrupted.

The Essex car, which will be built in the Hudson plant and sold largely through the Hudson dealer organization, is being shipped to distributors. This car will sell for \$1,395, which is the price placed upon it before manufacture was curtailed.

The small Overland model is now going through production and will be vigorously marketed within a few weeks. Beside these two, which are really not new models but simply models which were temporarily held out of manufacture pending the release of steel, there is no prospect for any marked introduction of new products until spring, and it is doubtful if there will be many until later in the year. The war ended so suddenly and the engineering brains of the country were so taken up with work that there was no opportunity

design and development during the war period. The result is that the new designs are just getting down on the drafting boards at the present time, and it will be spring before the experimental models are on the road.

Truck manufacturers will doubtless be rounding out their lines within the next few months. The Acason company is just about to start production on a new 1-ton design and it is expected that several other truck companies will have more complete lines as soon as they are able to free themselves from war orders.

A situation which is bothering passenger car manufacturers is the seeming expectancy on the part of the general public of big price reductions in the near future. This has resulted in tying up buyers who would otherwise be ordering cars. To combat this, a vigorous campaign is being pushed by manufacturers generally to bring before the public the knowledge that there will be no general price cut for months to come. Maxwell and Chalmers have guaranteed their prices to be stationary until June, 1919, and this stand will also be taken by many others who desire to clear up the impression that automobiles are due for a marked decrease in prices.

A very interesting phase which indicates the spirit of the manufacturer at the present time is the keen study being given to the subject of tractor manufacture. There is a marked tendency on the part of the larger factory to spread out into truck and tractor manufacture. This was noted to some extent before the United States entered the war, when companies such as the Maxwell Motors Corp. brought out a tractor. The General Motors Co. has already announced its intention of manufacturing a low-priced tractor on a large scale, and the Maxwell company will be ready to go ahead with it as soon as it is able to clear up its war contracts.

An embarrassing situation in regard to cancellations has arisen in connection with concerns which are making their standard product for the government. Many of these concerns had brought out new designs or altered designs, which were intended for the commercial market. Cancellations in whole or in part have caused large quantities of surplus material to gather which must be used up before the altered designs can be put into production.

## Endorse Federal Road Commission

### Chicago Meeting Unanimously in Favor of It—Graham Proposes Uniform Law

CHICAGO, Dec. 13—A Federal Highways Commission was proposed and definitely assured of the support of the Highways Industries Association and the Association of State Highway Officials at the three-day joint session of these bodies which was brought to a close to-night. As was forecast in AUTOMOTIVE INDUSTRIES last week, the meeting came out unequivocally in favor of the appointment of such a commission, which would be formed of five big, broad-minded men upon whom would devolve the duty of mapping, building and maintaining a system of national roads approximating 50,000 miles, to serve fully 90 per cent of the population of the United States, to cost in the neighborhood of \$25,000 a mile and to be fed by a system of state and county roads built by the individual states and counties with aid from the Federal Government.

With a view to encouraging and stimulating the already rapidly expanding use of trucks for interstate highway transportation, George M. Graham, president of the Pierce-Arrow Motor Car Co., proposed a uniform vehicle law which would wipe out the disadvantages under which interstate highway shippers now operate because of the great diversity of individual state laws.

#### Must Fit Trucks to Road

Referring to the alleged damage done to roads by trucks, Graham stated that the truck is as much sinned against as sinning. As a means to fit the trucks to the road, Graham suggests a minimum allowable weight for any truck with body and load of 24,000 lb. and that a plate giving the maximum allowable weight of any truck be attached to the vehicle. Exceeding this weight would be considered prima facie evidence of a misdemeanor.

Trailers also would be included under this measure. Below are the recommendations which Graham makes and which he would see incorporated in

uniform motor vehicle laws to be passed by the individual states.

#### Oil Industry Asked to Lift Restrictions

WASHINGTON, Dec. 16—The Fuel Administration has asked the oil industry to lift all its voluntary restrictions on crude oil prices and distribution and on refined products. This removes the entire oil industry from Government supervision. Unless events prove the necessity of again exercising control, says the announcement, this release will be permanent. The Administration points out, however, that licenses now outstanding will remain in force until the President's proclamation of peace, and all agreements made heretofore will continue subject to cancellation or assignment on request of the Fuel Administration. The allocation of supplies of petroleum products for the Allies will end Feb. 1 and the priority orders for export of gasoline and kerosene will expire at the same time. However, the allocation of aviation gasoline for the Allies and the American Expeditionary Forces will continue until further notice is given.

#### S. A. E. Visits Standard Aircraft Plant

NEW YORK, Dec. 16—At the invitation of the Standard Aircraft Corporation, 80 members of the Metropolitan section of the S. A. E. paid a visit to the plant at Elizabeth, N. J., to-day. During the morning, a tour of inspection was made through the various shops under the guidance of J. M. Meirick, superintendent of publicity, and B. L. Williams and other officials of the company. The visitors were shown through the wing and body shops, inspection, assembly and testing departments, where several H. S. 2 L. flying boats, Handley-Page giant airplanes and De Havillands are in process of construction. All of these are equipped with Liberty engines.

After a lunch provided for the visitors in a large dining room capable of seating 800, built for the officers and office staff of the company, the visitors were shown motion pictures which have just been taken in connection with Government publicity, depicting the work in the plant. Another picture showed the launching of the first American-made Handley-Page airplane, the Langley, which was made at this plant in ninety days and flown July 6.

H. B. Mingle, president of the company, made a short address to the S. A. E. members in which he expressed the hope that the company would be able to continue building airplanes for commercial uses. The company is now completing its Government contracts, and already the force of men has been considerably reduced. At the period of maximum production between 4,000 and 5,000 men and women were employed.

#### Shuler Moves to Louisville

DETROIT, Dec. 18—The Shuler Axle Mfg. Co. has removed its entire business and equipment from this city to a new plant in Louisville, Ky.

Height .....	12 ft. 6 in.
Width .....	96 in.
Weight, Vehicle, Body and Load**	24,000 lb.
Weight on tire per inch of width.....	800 lb.

Speed (M.P.H.)	Maximum	Suburban	City
Pneumatic tired vehicles under 6000 lb.....	30	20	15
Other pneumatic tired vehicles.....	25	20	15
Solid tired vehicles, 4000 to 28,000 lb*.....	25	15	12
Buses:			
6000 lb.....	30	20	15
7000 lb.....	30	18	15
8000 lb.....	25	20	12
Trailers:	Same as Trucks		

\*With following exceptions:

4000 lb.....	25	20	18
8000 lb.....	30	18	15
12,000 lb.....	18	15	12
16,000 lb.....	16	15	12

\*\*Highway Commissioner has discretionary power to increase this weight to 28,000 or more, depending on condition of roads.

## To Validate "Illegal" Contracts

### Measure Introduced to Insure Payment on Contracts Made Verbally or by Wire

WASHINGTON, Dec. 16—Important Congressional activities are expected this week that will affect automotive industries and war manufacturers generally. Opposition to the appropriation of \$2,185,000 for increased airplane mail service and for \$1,000,000 for extended motor truck mail service is expected to provoke keen discussion on the floor of the House.

In addition a very important bill introduced last week by Congressman Dent to provide relief for the War Department and allow it to make payments where Army contracts have not been made for war materials will come up.

This bill was introduced into the House to remove the present obstacle created by Controller Warwick of the Treasury, when he informed the War Department that he would not honor contracts that had not been "legally" executed, such as contracts that were made over long distance telephone verbally, or by telegraph, etc. Briefly, it authorizes the Secretary of War or his agents to accept and pay for articles or merchandise which had been ordered for the prosecution of the war but for which contracts had not been "legally" made.

The bill was discussed before the Committee on Military Affairs late last week by the Committee and Benedict Crowell, Assistant Secretary of War, Major General George W. Goethals, Director of Purchase, G. H. Dorr, Assistant Director of Maintenance, and Controller of the Treasury Walter W. Warwick.

The chief objection to the bill arising in the discussion was that it was too broad and allowed too free interpretation. It was further opposed in this meeting because it confers judicial powers on the Secretary of War, making the allowances provided by the Secretary of War final and conclusive.

There are three classes of contracts which enter under the "illegal" class, according to General Goethals:

1—Where a contract has been made and not signed by the proper officers, and where the contractor has delivered his material and been paid for it and the payments are illegal because the contract was not regularly signed.

2—Where the Government has received materials, signed no contract, and made no payments.

3—Where an order has been given to a contractor to make preparations to go to work, where he has expended the money, but delivered nothing under the contract at the time the armistice was signed.

General Goethals stated that it would be impossible at this time to tell how many contracts had been entered under these classes or their value but he estimated that there were thousands of contracts and millions of dollars involved.

It developed at the hearing that following the Spanish-American war a similar condition arose and many cases arising at that time are still in the Court of Claims, and, said the War Department officials, they are trying by means of this new bill to avoid a similar condition with the consequent business troubles that would arise.

Congressman Caldwell objected to the bill because he said there is no provision restraining the Secretary of War and further because the people who will pass on the contracts are, in many instances, or were, connected with companies involved, prior to the war.

The bill will come up this week and according to business men in Washington, there is urgent need that it be passed promptly by Congress or amended and passed promptly. Hundreds of manufacturers have been in Washington in the last few days solely on this matter and they state it creates a most perplexing problem for them particularly because their banks are fearful due to the doubt raised as to whether the manufacturers will receive just payment or not, and furthermore because in many cases the contractors have sub-contract arrangements which they are obliged to honor while their own arrangements with the Government are not being honored.

Following is the bill: "Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That where during the present emergency and prior to November 12, 1918, an individual, firm or corporation has made an agreement with officers or agents acting under authority of the Secretary of War for the purchase or use of land or improvements thereon, the manufacture or sale of equipment, material, or supplies for services rendered, or other lawful purposes connected with the prosecution of the war, and said agreement has been partly or wholly performed or expense has been incurred by the individual, firm or corporation in preparation for such performance, and, notwithstanding said agreement, has not been made in the form, or signed in the manner required by law, it shall be lawful to make payments under the terms of said agreement to the extent that performance thereof has heretofore been received and accepted by the United States or shall hereafter be received or accepted by officers or agents acting under authority of the Secretary of War, if the latter shall find the public interest require such acceptance;

"Provided that payment under such informal agreement shall not exceed the fair value of the property transferred or delivered and accepted by the United States, as determined by the Secretary of War, and where no property has been transferred, delivered, or accepted payment shall not be in excess of the actual cost incurred in preparation for performance as such cost is determined by said Secretary:

"Provided further, that no liability shall be incurred by the United States by reason of the passage of this Act, excepting such amount only as the Secretary of War shall find to be fairly and equitably payable under such agreement, which amount when received and accepted shall be in full of all claims and demands whatever arising out of or by virtue of such agreement, and nothing in this Act shall be construed to confer jurisdiction upon any court to entertain a suit against the United States upon any agreement of the character herein referred to, but the allowance made by the Secretary of War shall be final and conclusive."

WASHINGTON, Dec. 18—The House Military Affairs Committee to-day authorized Congressman Dent, chairman, to draw up a bill which will allow the Treasury Department to pay manufacturers who hold Government contracts

which were not legally executed and which have been held up heretofore by a decision of the Controller of the Treasury. The new bill will be a modification of the bill presented last week on this matter.

### Would Place Air Mail Under Army

WASHINGTON, Dec. 18—That the Government would save many millions of dollars by operating its air mail service under the supervision of the Army instead of the Post Office was maintained yesterday on the floor of the House by Representative La Guardia of New York, recently a Major in the Aviation Service. Congressman La Guardia, who favors an air mail service but opposes what he terms needless expenditure of millions of dollars for the Post Office Department to experiment with planes and train personnel when the Army and Navy Marine Corps already have established air organizations, promised the House a more extended talk on this matter in the near future, at which time he said he would give "the inside story."

### Use Argon for Aircraft

WASHINGTON, Dec. 18—The Navy Department is building a plant at Fort Worth, Texas, for the production of argon from natural gas for use in lighter-than-air aircraft. Argon is an inert, non-inflammable element without the hazard of fire or explosion.

### Truscon Enters General Field

DETROIT, Dec. 18—The Truscon Steel Co., which for a number of years has been producing pressed steel parts primarily for use in its own products, is entering the market and is prepared to furnish pressed steel parts of various kinds for other manufacturers.

### N. A. P. A. Branch in Kansas City

KANSAS CITY, Dec. 15—The twenty-second branch of the National Association of Purchasing Agents was organized in Kansas City Dec. 10, with the following temporary officers: President, M. E. Wilcox, Weber Engine Co.; secretary, E. E. Stigall, Kansas City Railways Co. The following visitors assisted the 25 local purchasing agents in effecting the organization: D. D. Ranken, assistant purchasing agent of the Du Pont companies, president of the National Association of Purchasing Agents; L. F. Boffey, editor of The Purchasing Agent, secretary of the national society; J. C. Densmore, purchasing agent of the University of Chicago, treasurer of the national association, and J. A. Hecker of the Curtis Mfg. Co., secretary of the St. Louis branch of the national organization.

### Klaxon Equipment Division for Detroit

DETROIT, I Co. has established its motor eq Grand Blvd. of Frank B.

## England Plans Post-War Show

Will Stage Event at Olympia Hall in November—Aviation Exhibits Likely

LONDON, Nov. 24—Special to AUTOMOTIVE INDUSTRIES—Within just one week from the announcement of the armistice terms the motor trade in England decided on a program of exhibitions for next year, the time being too short to hold the usual Olympia exhibition this November in accordance with pre-war rules.

The first post-war exhibition will be held in November, 1919, at the Olympia Hall, and while many post-war models will be marketed long before that date and are actually being announced now, that date will mark the first great bringing together of the post-war models. The Society of Motor Manufacturers and Traders will handle the show.

Other exhibitions are being discussed but dates have not been fixed. The increased importance of motor trucks and farm tractors points to a combined exposition of such vehicles at which will also be exhibited farm machinery specially designed for use with motor tractors.

Aviation expositions will be held throughout the British Isles. The lack of public interest in aircraft which existed previous to 1914 is now passed and aviation exhibitions will without doubt be great events, particularly as it is now recognized that there are many commercial uses for the airplane.

The war has added much stimulus to motor boating and some form of national motor boat and marine exhibit is being discussed. Such an exhibit in addition to catering to pleasure craft will include motor barges, fishing vessels and many other types using the explosion engine.

### Republic Issues \$3,000,000 Notes

NEW YORK, Dec. 17—The Republic Motor Truck Co., Alma, Mich., has issued \$3,000,000 of first mortgage and collateral trust 7 per cent serial gold notes for the purpose of reducing current floating indebtedness and to provide additional working capital for the further expansion of the business. Maturities are as follows: Series A, \$500,000, Nov. 1, 1920; series B, \$500,000, Nov. 1, 1921; series C, \$1,000,000, Nov. 1, 1922; series D, \$1,000,000, Nov. 1, 1923.

### Fiat's After-War Policy

NEW YORK, Dec. 16—There has been some speculation as to what would be the post-war program of the Fiat Co., Turin, Italy. It is not the intention of the company to concentrate on a single model; the number of types, however, has been reduced to what is considered to be a minimum. The lowest-priced vehicle will

be a light car; a special type of two-seater developed to meet European conditions. For the full touring model the engineers have decided on the 6-cylinder engine in preference to the 8 or 12. It has been decided that all models, from the cheapest to the most expensive, shall be fitted with electric lighting and starting specially designed for that particular chassis. Another mechanical change of interest is the adoption of detachable cylinder heads.

The after-the-war models are as follows:

	Model 500	Model 501	Model 502	Model 503
Engine, vertical monobloc	4 cyl.	4 cyl.	6 cyl.	6 cyl.
Horsepower	8-12	12-16	25-35	35-45
Weight, complete with touring body (lbs.)	1200	1900	3100	3900
Speed with full touring body (miles)	38-40	44-47	50-56	56-63
Wheelbase (in.)	95	105	130	143
Track (in.)	43	49	55	48

Commercial vehicles will form a separate and distinct branch of the Fiat after-the-war production. An agricultural tractor department has already been established and tractors are being supplied to the public.

## Price Changes

### Overland Reduces Price \$110

TOLEDO, O., Dec. 15—The Willys-Overland Co. has reduced the price of its Model 90 touring car, effective immediately, from \$1,095 to \$985.

### Cole Price Reduction of \$300

INDIANAPOLIS, Dec. 15—The Cole Motor Car Co. has reduced prices on all models of the Aero-Eight, effective at once. New and former prices follow:

Model	New Price	Old Price
871, roadster	\$2,595	\$2,895
872, 4-pass.	2,595	2,895
870, 7-pass.	2,595	2,895
Sedan	3,595	3,895
Limousine	3,695	3,995
Coupe	3,795	4,095
Town car	3,795	4,095

### Velie Prices Reduced

NEW YORK, Dec. 16—The Velie Motor Vehicle Co. has reduced the prices of its two models \$75 and \$65 respectively, effective at once. Following are the new and old prices:

Model	New Price	Old Price
33, 2- and 5-pass.	\$1465	\$1540
39, 4-pass. sport.	1975	2040

### Selden Trucks Go Up

ROCHESTER, Dec. 16—The Selden Truck Sales Co. has revised its price list. Following are the new prices effective Jan. 1:

Model	New Price	Old Price
TXR, 1-ton int.-gear.	\$1900	
TWL, 1-ton worm-gear.	2200	\$2100
JCB, 2-ton int.-gear.	2750	
JWB, 2-ton worm-gear.	3050	2950
NL, 3½-ton worm-gear.	3850	3650
DL, 5-ton worm-gear.	5000	4950

## Chicago Show Dates Jan. 25-Feb. 1.

Dealers Get Coliseum and Armory—Garden and Armory for New York Event

CHICAGO, Dec. 18—The Chicago Automobile Dealers' Assn. has completed all arrangements and set the dates for its show. The event will be held in the Coliseum and the First Regiment Armory as in previous years, with the first week, Jan. 25 to Feb. 1, devoted to passenger cars and the second week, Feb. 3 to 6, devoted to trucks.

The annual meeting of the National Association of Automobile Dealers will be held in the Hotel La Salle during the show, the dates being Jan. 28 and 29. During the New York show the N. A. D. A. will hold an eastern division meeting. The date probably will be Feb. 5.

NEW YORK, Dec. 16—In addition to Madison Square Garden the New York Automobile Dealers Association has secured the 69th Regiment Armory in which to house its big exhibit Feb. 1 to 15. The 69th Regiment Armory is a short square distant from the Garden and contains more space than there is in the Garden, which more than doubles the original size of the show.

The dual show will be equally good in both buildings. The armory exhibition is not to be an overflow, but an exhibition on an equal basis with the Garden show, with some of the best known cars in the industry in each building.

Manager Charles A. Stewart, who is operating in the association offices in the Woodward Hotel Annex at Broadway and Fifty-fifth Street, states that there will be quite an automotive equipment show in both buildings. In place of the usual 10 x 10 spaces given to the accessory people the spaces this year are to be 12½ x 12½, and in the armory they will all be arranged around the outside of the main floor. In the Garden the spaces will be in the gallery directly above the boxes.

### Bosch Brings \$4,150,000

NEW YORK, Dec. 18—The plant and business of the Bosch Magneto Co. was sold last week by Alien Property Custodian Palmer for \$4,150,000. It is stated that the company has been bought in by present interests and that it will be continued practically without change.

### Burnett Returns to Cadillac

DETROIT, Dec. 18—Leo N. Burnett has been released from active service in the Navy and returns to the Cadillac Motor Car Co. to resume charge of the advertising department. John A. Cleary, who was borrowed from the Automobile Sales Corp., Philadelphia, to fill Mr. Burnett's post for the duration of the war, has again taken up his duties as sales promotion manager for the Philadelphia concern.

# Further Light on Airplane Production History

Lieut. Emmons Reveals Details of Engine and Plane Plans—  
Life of Liberty Engine Put at Sixty Days—Foreign  
Estimate of Cost \$20 Per Horsepower

WASHINGTON, Dec. 16—At a meeting held last Saturday further outlining the airplane engine production during the war Lieut. H. H. Emmons, U. S. N., added interesting information to the official history of aircraft production which was published in AUTOMOTIVE INDUSTRIES recently.

A Liberty airplane engine, said Lieutenant Emmons, consumes an average of 20 to 25 gal. of gasoline per hour, depending upon the altitude, speed, etc. The original program for airplanes standing at the time war was declared, said Lieutenant Emmons, called for 332 planes. This was shortly after increased to 1000 planes, and then 3 weeks after the declaration of war, and following the receipt of information from abroad, the program was increased to 22,000 planes and was immediately approved by the Secretary of War.

## Great Quantity of Tools

In describing the difficulties encountered in the production of the Liberty engine, the lieutenant told that 2500 to 3000 jigs, tools, etc., had to be designed and manufactured especially for each manufacturer engaged in Liberty engine production, and from 80 to 85 per cent of these first made were found to be useless through poor work.

He stated that Major J. G. Heaslett, formerly of the Studebaker Corp., and during the war in complete charge of inspection, production and engineering at Detroit, was the man who was directly responsible for the large production of airplane engines which resulted up to the signing of the armistice. Major Heaslett, he said, working with a committee composed of H. M. Leland, Lincoln Motors Co.; C. H. Wills, Ford Motor Co., and Messrs. Bell and Roberts, of the Packard Motor Co., had full charge and complete authority for all engine production, and it was because of the work of this committee and of Major Heaslett that production amounted to 31,814 engines up to Nov. 11, 1918.

The Liberty engine, said Lieutenant Emmons, is rated at 410 hp., but often reaches 475 hp., and in several instances under special conditions has been developed to produce 526 hp. Its life at the front is estimated at 60 days. Airplane mechanics are instructed to overhaul at least once every 50 hours as compared with an overhaul every 20 hours with other airplane engines. The highest endurance record made by an airplane equipped with a Liberty engine was 162 hours in the air.

In discussing costs Lieutenant Emmons stated that the foreign nations figure the cost of an engine at \$20 per

horsepower. This would have placed the cost of the Liberty engine at more than \$8,000, and was immediately regarded as too high by the American officials who first set a bogey price of \$5,500 and later reduced this to \$4,000 after the manufacture showed it to be about the proper price.

The Wright-Martin Co., it was stated, received \$5,500 apiece for several thousand Hispano-Suiza engines it produced, this high figure being due to the royalties which had to be paid to Spain, as that country controls the Hispano-Suiza patents. The King of Spain, it was said, is the actual owner.

Discussing foreign engines and the American manufacturers' difficulties with them, Lieutenant Emmons said that when the specifications and drawings of the LeRhône engines were received they were almost unintelligible. They called, for example, for the use of mild steel when they should have specified chrome nickel, and the American authorities found it necessary to tear down an engine and analyze it to learn what metals were used in its manufacture before it was possible to make it.

There were 2500 LeRhône engines ordered, of which 1500 were delivered up to the signing of the armistice. These were made by the Union Switch Co., and were praised by the foreign chief engineer of the LeRhône factory abroad to be the best rotary engines he had ever seen.

## Bugatti Production Difficult

The mission sent abroad by our authorities early in the war recommended the use of the Bugatti engine in our planes and insisted upon its use from overseas, partly because they did not know fully about the Liberty engine and also because they thought that the Bugatti might prove to be a very satisfactory machine.

The Bugatti engine sent to this country as a sample had never made over a 35 hr. test. It had suffered an accident in France and arrived in this country with a bent crankshaft. The American authorities, after straightening the shaft, found it necessary to redesign the engine before going into manufacture on it.

In discussing airplanes it was said that the DeHaviland-4 plane was the only combat plane in which this country had reached quantity production. One hundred sets of parts for the Handley-Page plane had been completed and shipped abroad. These were shipped in part sets because of the size of the planes and the consequent advisability of assembling them abroad. We were just

entering into production on the USD9A, which is a substitute for the British DH9.

Three thousand Le Pere airplanes had been ordered from the Fisher Body Co. and Packard Motor Car Co., of which 25 were completed. Lieutenant Emmons paid high tribute to the Ford Motor Car Co., telling that they put 3 crews of men to work immediately when they received the orders for the Liberty engine cylinder, each crew experimenting to find the best production methods, and the company selected a method by which drawn steel tubes were cut in two by a special machine with a special die, heated, welded with cone-shape tops and then completed with bull-dozer machines.

## Army Fliers Map Air Lanes

WASHINGTON, Dec. 13—On their way from San Antonio to Houston, Tex., to-day, the four Army planes engaged in mapping a Southern air route across the continent had completed 1300 miles of reconnaissance from San Diego, Cal., where they landed at Kelly Field last evening.

The squadron left the Pacific Coast on Dec. 4 with five planes. One was lost in the fog near the mountains on the first day out and was forced to put back. The telegraph report received to-day at the Division of Military Aeronautics stated that the ground under the air route traveled between Alpine and Del Rio, Tex., was bad for landing fields, but from Del Rio east to San Antonio was excellent. The planes are photographing as they proceed East. The course they are flying to-day from San Antonio to Houston is 200 miles and it is expected that the flight will proceed from Houston straight to Gerstner Field, Lake Charles, La., and from there to Montgomery, Ala.

## 43,000 Army Trucks Purchased

WASHINGTON, Dec. 18—The annual report of the Quartermaster-General of the Army shows that the following purchases and deliveries were made up to June 15, 1918:

Type	Total ordered plus on hand at beginning of June 15, 1918	Total delivered to June 15, 1918
Trucks and chassis..	45,335	22,278
Trailers .....	1,213	696
Mobile machine shops	199	123
Passenger cars.....	8,369	8,277
Motorcycles .....	19,279	16,030
Side cars .....	17,899	14,636
Bicycles .....	13,796	12,314

## Army Planes for Air Mail

WASHINGTON, Dec. 15—The War Department turned over 100 DeHaviland-4 and twelve Handley-Page airplanes to the Postoffice Department to-day for air mail service. The DeHaviland planes can carry 400 lb. of mail and can be altered to carry 1200 lb. if necessary. The Handley-Page planes can carry more than a ton. The New York-Chicago airplane

route has been slightly changed, and Elizabeth, N. J., has been announced as the return terminal. Bellefonte, Pa., is the first regular stop, Leighton, Pa., the first emergency landing station and Cleveland the next stop, with an emergency station at Clarion, Pa. The last stop before Chicago is at Bryan, Ohio, where mail will be discharged and taken on.

#### Ban Aerial Acrobatics Over Cities

WASHINGTON, Dec. 13—Aviators have been ordered to refrain hereafter from low flying and from acrobatics carried on in the vicinity of cities, towns and buildings. All acrobatic flying hereafter must be finished at an altitude not lower than 1500 ft. These orders are the result of increased flying accidents. Commanding officers have been instructed to take most stringent steps to carry out the order.

#### Offers Prizes for Flights

WASHINGTON, Dec. 16—The Air Service Clubs Association, which is an association of officers and members of the United States Military Aviation Forces, will encourage tests in the air for both heavier-than-air and lighter-than-air machines and will award prizes for meritorious achievements. A committee will be appointed to pass upon these tests and flights.

#### 4045 Planes in Use Nov. 20

WASHINGTON, Dec. 16—On Nov. 20 there were 4045 pursuit, observation and bombing planes in use at the front by the American Expeditionary Forces, according to a letter from General Pershing to Secretary of War Newton D. Baker. Of this number 2675 were obtained from France and the remainder, 1370, from the United States. Up to Nov. 23, 1918, 8933 reserve military aviators had been trained in the United States. Total mechanics trained at American schools number 14,176.

#### Wants Air Mail to Alaska

WASHINGTON, Dec. 13—The extension of airplane mail service from this country to Alaska has been asked by Thomas Riggs, Jr., Governor of Alaska.

#### Brazil to Have Air Service

WASHINGTON, Dec. 13—Brazil will shortly have an air mail service between its principal cities. The Government has granted concessions to a corporation allowing it to establish airplane mail service between the various capitals of the states of Brazil. Activities will comprise carrying of small parcels of mail, and, with further development of aviation, carrying of passengers. The number of trips, and the tariff will be regulated by the Government. All mail matter transported must be properly stamped and post-marked. In time of war the Government may take over the service.

## P. H. Lyon Heads Jobbers; Manufacturers Now Members

CHICAGO, Dec. 18 — Automotive Equipment Association is the new name of the National Association of Automobile Accessory Jobbers, altered yesterday by constitutional amendment at the winter meeting of the organization. Another important constitutional amendment give to manufacturers full membership and places them on an equal footing with jobbers. Heretofore, manufacturers have been admitted only to associate membership.

Following the usual procedure, Vice-President Phil H. Lyon of the Chanslor & Lyon Co., San Francisco, was advanced from the post of vice-president to that of president. He succeeds S. F. Beech of the Motor Car Supply Co., Chicago. R. R. Englehart of the Seig Co., Davenport, Ia., advances from chairman of the board of directors to the vice-presidency and is succeeded by Robert A. Stranahan of the Champion Spark Plug Co., Toledo.

#### Lame Start for Chicago-New York Air Mail Service

NEW YORK, Dec. 18—To-day marked the inauguration of the first long-distance airplane mail service in the United States when two planes departed almost at the same time from New York and Chicago to fly the 1000 miles between these centers. Neither plane reached its destination, which in each case was a sub-station approximately 200 miles from the starting point whence the mail was to have been relayed to another sub-station a similar distance from the first and thence to the end of the line.

Leon D. Smith, an army flier, started from Belmont Park, L. I., in a Liberty-engined De Haviland, but was forced to land at Bellefonte, Pa., 236 miles from the starting point; "from here the mail was forwarded to Chicago by train. Delay at the Chicago end was caused by inability of the planes to reach that city from Defiance, Ohio. It was expected that a start would be made from Grant Park, Chicago, at 10 a.m., but this was impossible. Officials state that it will be several days before the service is operating smoothly.

Only first-class mail will be carried, the rate being 6 cents an ounce or fraction; parcels not exceeding 30 in. combined length and girth may be sent. It is expected that the service will cut the time between the two cities five to six hours.

#### Ajax Issues \$1,000,000 Stock

NEW YORK, Dec. 18—The Ajax Rubber Co. has issued new common stock in the amount of \$1,000,000 to provide additional working capital for the company. Stockholders of record on Dec. 27 will be permitted to subscribe for the new issue of 20,000 shares of a par value of \$50 each on the basis of 10 new shares for each 71 old shares of stock now held at \$55 a share. The right to subscribe will expire Jan. 15. Including the new stock,

the company will have outstanding 162,000 shares, bringing the outstanding stock from 7,100,000 to 8,100,000.

#### Federal District Managers Meet

DETROIT, Dec. 18—District sales managers of the Federal Motor Truck Co. gathered here to-day for a sales convention which will continue on Thursday and Friday. The gathering will threaten the sales policy of the concern, which is now getting back on a commercial basis after extended war work on Class B trucks and Federal trucks for the government.

#### Recent Personnel Changes

A. C. Stebbins, president of the Lansing Co., and vice-president of the Capital National Bank of Lansing, Mich., has been appointed general manager of the Auto Body Co. of this city, succeeding H. E. Bradner, who withdrew from active management of the institution on account of ill health. He continues as president of the company.

K. R. Jacoby, who has been assistant to C. A. Earl, first vice-president of the Willys-Overland Co., Toledo, has been elected to a vice-presidency in charge of purchases of the company.

B. W. Knowles, formerly chief engineer and factory superintendent of the Electric Products Co., Cleveland, has been appointed chief engineer of the Baker R. & L. Co. of the same city.

C. C. Winningham, formerly advertising manager of the Hudson Motor Car Co., Detroit, and more recently engaged in the Department of Labor, Washington, has established an advertising agency in Detroit with headquarters in the Book Building. No one has been named to succeed Mr. Winningham.

#### War Machinery Crumbling

WASHINGTON, Dec. 17—The war machinery here is fast crumbling. The War Industries Board, which is already to a great extent through, plans to turn over several more important departments to the Department of Commerce and Department of Interior on Jan. 1. Members of the Priorities Division have closed their desks and returned to their peace time duties. C. C. Hanch, head of the Automotive Section, is still continuing his work, which he thinks may be carried into the early Spring because of the difficulties arising from contract cancellations, but which, according to statements by Bernard M. Baruch, will probably be terminated with the beginning of the New Year, when contractors may have to deal directly with the War Department and not through the Section.

The Fuel Administration is preparing to turn over its departments on oil and gas to the Department of Interior and cease activities on Jan. 1. At the Bureau of Aircraft Production, where complete silence is maintained with regard to aircraft contract cancellations because it is feared that public announcement might have ill effects on the markets, activities are solely confined to this one phase of work and everyone is marking time awaiting Congress' decisions.

as to further appropriations for airplane activity.

The War Trade Board is rapidly modifying the restrictions on exports and imports and is one of the few departments which are continuing actively. The Motor Vehicle Section of the Quartermaster Department, which has been in charge of procurement and purchase of motor vehicles, is preparing to end activities by February 1, 1919. By that time it is expected that all contracts will be in such shape that the work of this division can be transferred to the army.

The Motor Transport Corps is also marking time, awaiting the decision of Congress and the General Staff. It is expected that this corps will be permanent and will continue its activities of operating and maintaining army motor vehicles to some degree.

The Division of Military Aeronautics, waiting on Congress for its decisions, is engaged solely in the work of returning aero squadrons from the front and maintaining those few which will be kept up there. The preliminary training of cadet aviators has ceased. The Ordnance Department, Quartermaster Department, Engineer Corps, in fact all the various army divisions are discharging men and terminating their war duties as fast as possible. The important civilian heads are returning rapidly to their peace time work.

#### Postoffice Bill Passes

WASHINGTON, Dec. 19—The Annual Postoffice Appropriation Bill, carrying \$357,350,000, including \$2,185,000 for air mail service and \$1,000,000 for motor truck mail service, passed the House yesterday with but one important amendment, which cuts the air mail appropriation to \$300,000 and requires the postoffice to use army aviators instead of organizing a new flying corps and stipulates the airplanes to be turned over to the postoffice by the War Department. It provides that the War Department shall supply more than 200 planes and more than 200 separate engines, and that these will be operated and maintained by the army under the control and direction of the Postmaster General. The bill now goes to the Senate.

The planes to be turned over by the War Department are specified in a section of the amendment as follows: "The Secretary of War is hereby directed to deliver immediately to the Postmaster General 100 De Havilland Fours, 100 Handley-Paige, 10 Glenn Martin day bombers; all planes to be completely assembled and with spare parts; 50 Hispano-Suiza 300 hp., 20 Hispano-Suiza 150 hp., 100 Liberty engines with spare parts, these to be out of any equipment the War Department has on hand or under construction; the War Department appropriation to be credited with the equipment turned over to the Postoffice Department."

The \$1,000,000 appropriation for the operation of the motor truck mail service passed without change. The expenditure on any other appropriation for the improvement of highways was prohibited by striking out this clause of the bill.

#### Truck Club Has Dealer Division

NEW YORK CITY, Dec. 18—The election of officers for 1919, the formation of a dealers' division and a strong talk by H. S. Quine of the Goodyear Tire & Rubber Co. were the features of the annual meeting of the Motor Truck Assn. of America held here to-night. The 1919 slate elected follows: Charles M. Geiger, president; John M. Wierk, L. E. Campbell and A. C. Bergmann, vice-presidents; Joseph Husson, secretary, and William P. Held, treasurer.

## Lift Lid on Nearly All Exports

### Practically Everything Can Now Be Sent to Allies—Ships for Trade Routes

WASHINGTON, Dec. 14—An almost unlimited export of commodities to the United Kingdom, France, Italy, Japan and other colonies was announced to-day by the War Trade Board, effective at once.

The commodities which will be allowed for export have not been specifically named, but include practically everything not on the conservation list, which has already been considerably reduced and which does not include, at this time, automotive products.

Each individual application for license, however, will be reviewed separately by the War Trade Board. At the same time the board will adopt a liberal policy of export for all countries for all materials except foodstuffs and with the sole exception of Germany, against which there will be no relaxation of blockade during the armistice period. The board expects also to open up completely export shipments to the neutral countries, including Norway, Holland, Sweden, Switzerland and Spain within a few days.

Ships with an aggregate carrying capacity of 800,000 tons have been designated to be turned over by the Quartermaster Department of the Army to the Shipping Board for return to trade routes, and this is expected to be one of the important factors in further reducing restrictions against export. It is expected that the ships will be used principally for trade with South and Central America.

#### W. T. B. to Consider Import Applications

WASHINGTON, Dec. 16—The War Trade Board will now consider applications to import platinum, antimony, tin and tin concentrates from Russia, including Siberia and Finland. It will also give consideration to the importation of other commodities, but will give preference to those named above and to seeds, roots and skins. A limited amount of cargo space is now available for shipments from Vladivostok to points on the Pacific Coast of the United States.

#### Spanish Duty on Cars Changed

WASHINGTON, Dec. 15—Passenger automobiles which have heretofore been dutiable on gross weight in shipments to Spain are now dutiable on the basis of net weight, according to a commerce report. It is expected that this new plan will remove the discrimination which has existed by reason of the fact that automobiles might be unpacked in the free port of Cadiz and entered on the net weight, whereas duty was charged on the gross weight in other ports. It was reported that a number of automobile manufacturing companies had established warehouses in the free port of

Cadiz to take advantage of this condition. Under the new ruling nothing will be gained by such procedure, and the Consul General reports that the dismantling of automobiles in the free port of Cadiz is no longer permitted.

The same order provides that forgings or castings for the construction of automobiles imported in the condition in which they left the forge or foundry shall be dutiable as manufactures of forged or cast metal according to the weight. Other parts, whether finished or partly finished, are to be classed as automobile parts. On leaving free ports automobile parts will be subject to duty proportionately as automobiles.

#### Articles Removed from Export List

WASHINGTON, Dec. 15—The following articles are included among the commodities which have been removed from the export conservation list, according to an announcement made to-day by the War Trade Board:

Alloys, as follows: Cadmium; nickel; titanium; uranium; zirconium.  
Aluminum, all articles containing 10 per cent or more (in weight) of metallic aluminum.  
Antimony; articles containing antimony; ore.  
Brass, and all articles containing 10 per cent or more (in weight) of brass.  
Brass pipe.  
Brass plates.  
Brass sheets.  
Brass tubes.  
Brass wire.  
Cadmium, as follows: Alloys; metal.  
Chromium ore, and any metal or ferroalloy thereof.  
Cobalt ore, and any metal or ferroalloy thereof.  
Copper, as follows: All articles containing 10 per cent or more (in weight) of copper; pipe; plates; rods; sheets; tools; scrap; tubes; wire.  
Ferroalloys, as follows: Ferrocobalt; ferrochromium; ferrocobalt; ferromanganese; ferromolybdenum; ferrotitanium; ferrotungsten; ferrovanadium; ferrovanadium; ferrozirconium.  
Lead, as follows: Pipe; sheet.  
Machines, as follows: Oil-well drilling, and accessories.  
Manganese ore and any metal or ferroalloy thereof.  
Manganese oxide.  
Nickel, all articles containing 10 per cent or more (in weight) of nickel.  
Nickel alloys.  
Ore, as follows: Antimony; chromium and any metal or ferroalloy thereof; cobalt and any metal or ferroalloy thereof; manganese and any metal or ferroalloy thereof; radium; strontium; titanium; tungsten and any metal or ferroalloy thereof; uranium; zirconium.  
Pyrites.  
Titanium and its compounds.  
Titanium ores.  
Uranium, as follows: Alloys; ores.  
Vanadium.  
Zinc or spelter.  
Zirconium, as follows: Alloys; metals; ores or concentrates.  
Carbon electrodes.  
Cells, electrolytic.  
Electrodes, as follows: Carbon; graphite (plumbago).  
Electrolytic cells.  
Generators, suitable for searchlights.  
Radio and wireless apparatus and all accessories.

#### New York-Valparaiso Boat Service Resumed

WASHINGTON, Dec. 15—Direct passenger service by boat has been resumed between New York and Valparaiso, following orders by the United States Shipping Board for the release of the tonnage. It is expected that, however, will only be given to immediate commercial needs for the time being.

## Rubber Imports Still Decline

November Strikes New Low Level—Total for 11 Months Far Behind Last Year

NEW YORK, Dec. 16—Importations of crude rubber have been steadily declining during the past 11 months and during the month of November reached a new low level when the total tonnage to come in amounted to only 3363 tons. As compared with November, 1917, when 13,611 tons were imported, this is a loss of 10,248 tons. Similarly, there was a big drop in the figures for November this year as compared with October, the loss being 6146 tons.

The total imports for the 11 months to date are approximately one month's supply below those for the same period last year, taking an average month's imports as a guide. During this period in 1917 imports totaled 158,906 tons as compared with 144,003 tons for the first 11 months of 1918. The loss in this case is 15,903 tons. Following are the statistics as compiled by the Rubber Association of America:

	1917 Tons	1918 Tons
January .....	12,788	16,084
February .....	10,162	12,108
March .....	18,624	17,161
April .....	13,000	12,708
May .....	18,411	16,288
June .....	15,096	24,124
July .....	17,290	16,092
August .....	17,290	10,421
September .....	13,664	5,151
October .....	8,970	9,509
November .....	13,611	3,363
Total .....	158,906	144,003

### Restrictions on Import of Rubber Removed

WASHINGTON, Dec. 16—All restrictions on the quantity of crude rubber imports from overseas have been removed, according to an announcement made here to-day by the War Trade Board. Applications for licenses to import crude rubber will now be considered without limit as to quantity. The War Trade Board also announces that it withdraws the Government option price and will require no further undertakings relative to maximum values. It will continue to require guarantees similar to those asked in the past. Modification of rubber imports, however, will not allow importation of rubber from any other than the country of origin until after Feb. 13, 1919.

### Re-Exports of Rubber Decline

WASHINGTON, Dec. 15—Re-exports of raw rubber, including waste and reclaimed, declined in quantity from 81,775,700 lb. in the first 9 months of 1916 and 101,749,400 lb. in the first 9 months of 1917 to 31,209,900 lb. for the first 9 months of 1918, and the value fell from \$57,985,880 in the first named period and \$70,869,089 in 1917 to \$18,396,514 in 1918. Imports of raw rubber in England, in-

cluding waste and reclaimed, totalled \$84,241,355 for the first 9 months of 1916, \$91,893,137 for the first 9 months of 1917, and decreased to \$44,856,792 for the first 9 months of 1918, while the quantities decreased to 79,221,400 lb. in 1918 as compared with 148,720,800 lb. in 1917 and 128,141,000 lb. in 1916.

### Great Reduction in Rubber Exports from London to the U. S.

WASHINGTON, Dec. 15—In the 10 months ending October, 1918, rubber exports from London to the United States totalled \$3,743,639 as against \$39,770,603 for the same period of the year previous, according to a Commerce Report.

### Exports to Federated Malay States

WASHINGTON, Dec. 16—Automobiles, tractors and parts and accessories can now be exported to the Straits Settlements and the Federated Malay States. The restrictions against these exports which have been in effect since May 16, 1917, have been revoked, according to a cablegram received here from the American consul-general at Singapore.

### Preference for Certain South American Exports

WASHINGTON, Dec. 15—Ocean shipments for exports to the east coast of South America will be controlled under a preference arrangement by the War Trade Board in co-operation with the Shipping Control Committee of the United States Shipping Board. "Shipping preference No. 1" will be awarded in exceptional cases when shipment is of the utmost importance and all shipments given this preference will have priority over all other shipments. In order to expedite the completion of export contracts entered into prior to the recent relaxation of the granting of licenses, the Shipping Control Committee will give priority in loading to shipments covered by export licenses dated prior to Nov. 12, 1918.

It will not be necessary for the holders of licenses to make further application or secure any endorsement to get this priority. Holders of licenses already issued and applicants for new licenses who believe that they are entitled to "shipping preference No. 1" can file a request with the War Trade Board.

Exporters should expect, says the War Trade Board, under present shipping conditions, that there may be considerable delay in exporting commodities licensed subsequent to Dec. 8, 1918, and not covered by "shipping preference No. 1."

### Making of Contracts Discontinued

WASHINGTON, Dec. 16—Making of contracts by the various War Department divisions for the purpose of clearing up stocks held on hand by manufacturers has been stopped by an official order issued late last week, and for the present no further contracts on war materials are being made.

## M. T. C. Will Keep Its Vehicles

No Sale of Cars or Trucks—Taxi Plan of Pooling Transportation Successful

WASHINGTON, Dec. 13—All passenger cars and standardized trucks now in the possession of the Motor Transport Corps in this country will be retained by the Army, according to an official announcement made here to-day. Non-standardized trucks and Nash Quad trucks will be turned over to the Post Office Department to fill its requirements, or, states the announcement, possibly, in the case of the Nash trucks these will be put on the market for sale. Rumors that the Army would sell large numbers of Dodge, Cadillac and other passenger cars at low prices are erroneous. None of this equipment will be sold.

### \$200,000 Saved a Month

In its monthly report the Army Motor Service, which is the taxi service for the Army in Washington and elsewhere, shows a saving in expense of operation of passenger vehicles in the Army amounting to \$200,000 for November as compared with the expenses of October.

Prior to Nov. 1 cars for the use of the Army were assigned to individuals or to various departments. Now, with the exception of 33 cars assigned to heads of departments, all passenger equipment of the District of Columbia is pooled and motor busses are operated on a sort of taxi system between the various principal buildings.

These busses and the passenger cars are for official use only. Thirteen principal stations have been established for them and telephone service can call these cars for official business similarly to the usual call for taxicabs.

In the month of November 14,899 trips were made in the District of Columbia covering 106,608 miles. Prior to Nov. 1 the average number of cars in operation per day was 257 passenger cars and 2 busses. Since Nov. 1 141 passenger cars and 11 busses have operated daily.

The taxi system has been so successful that it will be inaugurated at once in New York, Philadelphia, Chicago, St. Louis and Atlanta.

### Trucks in U. S. Also Pooled

The motor trucks used by the Army in the United States have also been pooled and are now operated for the benefit of the Army as a whole under the Motor Transport Corps management. The reduction of expense on trucks has not yet been reported, but it will be far greater than that on passenger service.

The number of garages for Army vehicles in Washington has been reduced by means of the taxi system and pooling from 16 to 8. Eventually all cars under the corps will be driven by enlisted men, thereby reducing the wage account and insuring better care for the equipment.

**Elliot C. Morse Returns to New York**

WASHINGTON, Dec. 16—Elliot C. Morse, formerly vice-president of the Chalmers Motor Car Co., and the past year in Washington as the general representative of the Willys-Overland Co. in Government contract matters, is leaving Washington to head the export work for the Willys-Overland interests in New York City.

A. C. Harrington, vice-president of sales of the Packard Motor Car Co. of New York, has resigned to handle the national truck accounts for the Packard factory. The new office of manager of distribution, created to fill Mr. Harrington's place, will be held by H. Bertram Lewis, advertising manager. In addition to the direction of carriage, truck, used vehicle, custom body and accessories sales, Mr. Lewis will supervise the advertising and motor transportation departments. Charles B. Morse, manager of direct advertising, and William Carl Chapman, publicity manager, will handle the company's advertising under his supervision.

T. T. Fauntleroy has been appointed sales engineer for the Lakewood Engineering Co., Cleveland, with headquarters at 1034 Widener Bldg., Philadelphia. He was formerly New York branch manager for the Gurney Ball Bearing Co. and latterly has been manager of the central sales district for the same company.

Prescott C. Ritchie, Western representative of the Westinghouse Automobile Equipment Department, moved his headquarters from Indianapolis to the Conway Building, Chicago.

Captain Edward Vail, who left the Waltham Watch Co. to follow the flag, has been appointed on an adjustment board and probably will have his headquarters in New York. He expects to be released from service in February.

Herbert C. Severance, secretary and sales manager of the Racine Rubber Co., Racine, Wis., and one of the best known figures in the American tire and rubber industry, died at his home in Racine on Nov. 23. Mr. Severance was born in Cambridge, Mass., on Oct. 28, 1878.

T. J. Turk, formerly connected with the Kissel Motor Car Co. and the General Motors Truck Co., has resigned his position as assistant general manager of the Inter-State Motor Co.

**Wants American Agencies**

NEW YORK, Dec. 15—J. R. Bournigal, P. G., Puerto Plata, Dominican Republic, has become affiliated with a company styled Ecos Del Norte, which at present is operating as a manufacturer's representative. The firm is anxious to affiliate itself with manufacturers of American specialties, with the object of representing such manufacturers.

## Men of the Industry

### *Changes in Personnel and Position*

**British Representative Coming**

NEW YORK CITY, Dec. 15—Capt. A. S. F. Morris, R. A. F., managing director of Morris, Russell & Co., London, England, is expected to arrive in New York shortly, and will make his headquarters at the New York office of the company, 14-16 Church Street. He will be here in the interest of this firm, which is looking for representation for car accessories and parts.

**England Sees Development of Commercial Aviation**

*(Continued from page 1064)*

The increased use of gasoline has already led to suggestions for greater production of petroleum and the possible use of other grades of fuel. The war has impressed on Great Britain in many ways the importance of gasoline in the entire transportation system of the nation and the development of fuels is certain to receive much attention.

Nothing definite has been done in the laying out of aerial highways further than that it is recognized that there will be main routes such as London to Edinburgh; London to Glasgow; London to Paris; London to Dublin; London to Russia; London to the Riviera; London to Africa, and other routes pointing toward India and Australia.

Laws governing aerial transportation and aerial navigation have already been considered and conferences will soon be called to deal with these and kindred questions. There must be settled the question of the right of any nation to control of the air above its land and also above its 3-mile water limit, which zone of air might for convenience be called the terrestrial air limit.

The conclusion is that a 3-mile limit for air surrounding the boundaries of a country along the water will not suffice and that a conference will be necessary to determine the best limit.

A host of problems will arise in connection with international flying, such as passports, customs regulations, signals, aerial traffic regulations, aerial trespassing, and injury to persons and property due to aerial navigation.

While aviation has been brought to its present success largely through government requirements in the war, sentiment is fairly general that commercial aviation should be as free as possible from government control and that the great experiments in business flying must be made by individuals and individual corporations. It is not incumbent upon the state to carry on such work. The state must take up very early all questions relating to necessary legislation.

**Don E. Bailey Dies**

SAN FRANCISCO, Dec. 16—Don E. Bailey, for 10 years intimately connected with the Bailey-Drake Co., which he founded, died Nov. 29 from pneumonia, following an attack of influenza. Mr. Bailey organized the Bailey Specialty Co. in San Francisco and this was later changed to the Don E. Bailey Co. In 1914 Mr. Drake, then general sales manager of the Remington Arms Union Metallic Cartridge Co., resigned that position to enter the firm, when the name was changed to Bailey-Drake Co. At present the company has branches in San Francisco, Seattle and Kansas City, the principal headquarters having recently been moved from San Francisco to Chicago.

**Prominent Maine Dealer Dies**

PORTLAND, Dec. 15—Albert M. Speare, Jr., one of the most widely known automobile men in New England, and president of the Portland Automobile Dealers' Association, died here yesterday after a brief illness. He had handled some of the best known cars on the market, and he was the distributor of Dodge Brothers cars since that line was introduced into Maine.

**Harry Biggs Appointed General Sales Manager of Studebaker**

CHICAGO, Dec. 15—Harry Biggs has been appointed general sales manager of the Studebaker Corp., South Bend. He was formerly Chicago manager for the Frank Seaman Advertising Agency.

**McAdoo Leases Houk Home**

LOS ANGELES, Dec. 16—W. G. McAdoo, former secretary of the treasury and director of railroads, has leased the Los Angeles home of the late George W. Houk. He will move in Jan. 1 and occupy the premises for three months.

**Turner Goes to Buick**

NEW YORK, Dec. 15—Frank Turner, formerly comptroller of the Du Pont Co., has been appointed comptroller of the Buick division of the General Motors Co., with headquarters at Flint, Mich. J. B. Broad is appointed to the vacant office of the Du Pont Co.

**Tractor Show in Milwaukee**

MILWAUKEE, Dec. 14—One of the largest and most comprehensive exhibitions of tractors and power farm machinery ever staged under one roof was that which accompanied the thirteenth annual convention of the Wisconsin Implement Dealers' Association at Milwaukee, Dec. 10, 11 and 12. The entire Auditorium was pressed into service to accommodate the display, the general sessions, and sectional meetings. The machinery exposition contained more than 350 distinct exhibits, from giant tractors to automatic milkers. Farm lighting systems were an interesting feature.

**Holt Back on Peace Work**

PEORIA, Dec. 15—The Holt Mfg. Co., which has been engaged for the past 18 months in manufacturing tractors for the war department to be used in Europe, has returned to a peace basis, all war contracts having been cancelled. For a time, three shifts of employees, working 8 hours each, were required to keep pace with the orders. The company has employed 6000 men the greater part of the year.

From now on, the plant will be devoted exclusively to the manufacture of tractors for agricultural and commercial purposes. Camp Herring, the War Department's instruction school for the training of tractor drivers and mechanics, operated adjoining the Holt plant, has been closed and the barracks and other buildings will be dismantled. As rapidly as a trainload of tractors was shipped, a squad of drivers and mechanics, sufficient to take care of each machine, was sent along. In all 5000 tractor drivers and mechanics were trained at Camp Herring, and these men are now returning from Europe and, in many instances, will be seeking employment from tractor owners. Their thorough training will render them invaluable to farmers who favor tractors.

**Canadian Hayes to Make Axles**

CHATHAM, ONT., Dec. 16—It is stated that the Hayes Wheel Co. will shortly begin the manufacture of complete axles in addition to its present line of wheels, hubs, rims, etc. The company has been handling a large shell contract for the Canadian Government in a special plant. The plant was laid out and equipped with a view to converting it for the construction of passenger car axles and the present plan is to convert the plant as quickly as possible.

**Killen-Straight on the Block**

APPLETON, Wis., Dec. 14—The plant and other assets of the Killen-Straight Mfg. Co., Appleton, Wis., manufacturer of tractors and gas engines, were sold at receiver's sale on Dec. 12 to A. W. Priest, an Appleton manufacturer, who intends to use the plant for the production of pumps, blowers and similar mechanical devices and discontinue the tractor line. The purchase price is \$22,000, which requires confirmation by the Circuit Court on Dec. 23. The Killen-Straight Co. was placed in the hands of a receiver early in June this year.

**Happy Farmer Increases Capital**

BUCYRUS, OHIO, Dec. 16—The Ohio Happy Farmer Tractor Co. has increased its capitalization from \$20,000 to \$40,000. The new issue consists of 200 shares of common stock of a par value of \$100.

**Four-Wheel La Crosse Tractor**

LA CROSSE, WIS., Dec. 16—The La Crosse Tractor Co. is shortly to enter the market with a four-wheel type of farm tractor. This will be known as model G, and though it differs considerably from

## Current News of Factories

*Notes of New Plants—Old  
Ones Enlarged*

its predecessor, model F, it is not entirely a new model, but is essentially a modification of the former, in which two front wheels take the place of the single front wheel used heretofore.

**Detroit Office for General Steel**

MILWAUKEE, Dec. 15—The General Steel Co., manufacturer of die blocks, piston rods and tool steel, will hereafter be represented in the Michigan district by D. J. Crowley, 823 Dime Bank Building, Detroit.

**\$7,628,783 for Army Cars**

WASHINGTON, Dec. 14—A statement of expenditures in the annual report of the Chief of Ordnance shows that a total of \$7,628,783.67 was expended for the fiscal year of 1918 for Army motor cars.

**The Use of Measuring Wires***(Continued from page 1056)*

the first or simple formula for 60-deg. threads rarely equal 0.0001 in., and then only when the helix angle is large.

It has been claimed that measurements of effective diameter made by the three-wire method result in values which are smaller than those secured by other means, such as by thread micrometers. This contention is probably justified in some cases and may be due to insufficient care in making measurements. It is important in making measurements that as little pressure as possible be applied on the wires with the measuring micrometers. Since the wires rest in a V-thread, a given pressure exerted on the top of the wire will have a magnified effort of distorting the wire where the contact is made on the sides of the thread. This will result in the measurement over the wires being less than it should be. Furthermore, if the wire is standardized under a light pressure and then used with a larger pressure the diameter of the wire which is substituted in the formula for computing the effective diameter will be larger than it should be. This difference is multiplied by the factor 3 in the formula and the tendency is to make the result small. Excess pressure is often placed upon the wires during the measurement by use of ratchet or friction stops on micrometers; or by an unskilled operator, and sometimes on account of the arrangement of the wires and the screw thread when the measurements are taken. It is poor practice to support the screw being measured on two wires which are in turn supported on a horizontal surface, for if the screw is of large diameter the weight of the screw causes a distortion of the wires and interferes with the measurement.

**Studebaker to Double Capacity**

SOUTH BEND, Dec. 16—According to present plans of the Studebaker Corp., the South Bend plant will add 7000 employees during the next year and double the present capacity of the factory. The plant will be in complete operation by the summer of 1920. The new plant will have a capacity of 100,000 finished automobiles annually, and with the 60,000 annual output of its combined Detroit plants, the corporation will more than double its capacity in the manufacture of cars.

**\$15,000,000 Studebaker Notes Issued**

NEW YORK, Dec. 16—The Studebaker Corp. has completed the financing plan which has been on the boards for several weeks and this takes the form of an issue of \$15,000,000 in 7 per cent serial notes maturing in various amounts from Jan. 1, 1921, to Jan. 1, 1929.

**"The Automobile After the War"***(Continued from page 1058)*

a publicity campaign appropriate to the section of the country and the kind of purchasers to be reached; keeping a large stock of parts of different cars and models ready to be delivered to owners; a large stock of accessories and an up-to-date shop sufficiently well equipped to carry on even very important repairs; maintaining a large number of show cars by means of which it would be possible to demonstrate to the prospective buyer the dominant qualities and advantages of each model. As to the methods of payment, cash or different installment plans should be offered to the buyer. This is an indispensable condition of popularizing the automobile among small manufacturers, doctors, veterinary surgeons, etc. In this connection Mr. Cote mentions the "automobile bank" which was organized for this purpose but failed. Here is a field in which financiers can take the initiative and start a financial organization in which the manufacturers could well afford to participate.

**Branch Office vs. Direct Agency**

Mr. Cote is in favor of direct agencies and thinks that this is the best method for both the buyer and the manufacturer. Further, he thinks that these should be located throughout France and its colonies. On the other hand, he believes it would be a serious mistake not to take advantage of independent organizations which already possess a number of garages and repairshops. These would prove valuable auxiliaries to the automobile industry, and there is no reason why sufficient guarantees could not be offered to such organizations to include them in a general association as described above, and having a purely commercial purpose.

Mr. Cote is very much in favor of combining and centralizing in an independent and democratic way manufacturers and sales organizations to lead the automobile industry to triumphant success. This success can be attained by co-operative but not by isolated efforts.

- March 1-10—San Francisco, Cal. Motor Car Dealers' Assn. G. A. Wahlgreen, Manager.

- March 10-15—Syracuse, N. Y. Syracuse Automobile Dealers' Assn. Harry T. Gardner, Manager.
- Second or third week March—St. Louis, Mo. St. Louis Auto Mfrs. & Dealers' Assn. Robert E. Lee, Manager.
- March 15-22—Boston, Mass. Boston Automobile Dealers' Assn. Chester I. Campbell, Manager.
- March 22-29, Passenger Cars; April 1-5, Trucks—Brooklyn. Brooklyn Motor Vehicle Dealers' Assn. I. C. Kirkham, Manager.
- Third week March—Trenton, N. J. Trenton Auto Trade Assn. John L. Brock, Manager.
- Probably March—Chicago. Chicago Automobile Trade Assn.
- March—Philadelphia. Philadelphia Automobile Auto Trade Assn. A. L. Maltby, Manager.
- March—Pittsburgh. Automobile Dealers' Assn. of Pittsburgh. John J. Bell, Manager.
- March—Syracuse, N. Y. Syracuse Automobile Dealers' Assn. Harry T. Gardner, Manager.
- March—Utica, N. Y. Utica Motor Dealers' Assn. W. W. Garabrant, Manager.
- Late March or early April—Cleveland, Ohio. Cleveland Auto Show Co. Fred H. Caley, Manager.
- April 5-12—Montreal, Can.—National Motor Show of Eastern Canada, Victoria Rink. T. C. Kirby, Manager.

- Not decided—Bridgeport, Conn. Auspices of City Battalion. B. B. Steiber, Manager.
- Not decided—Harrisburg, Pa. Harrisburg Motor Dealers' Assn. J. Clyde Myton, Manager.
- Not decided—Hartford, Conn. Hartford Automobile Dealers' Assn.
- Not decided—Indianapolis, Ind. Indianapolis Auto Trade Assn. John B. Orman, Manager.
- Not decided—Kansas City, Mo. Kansas City Motor Dealers' Assn. E. E. Peake, Manager.

## TRACTOR SHOWS

- Feb. 10-15—Kansas City, Mo. Fourth Annual Tractor Show. Sweeney Building. Kansas City Tractor Club. Guy H. Hall, Sec.
- Feb. 18-22—Wichita, Kan. Annual Mid-west Tractor and Thresher Show. Wichita Tractor and Thresher Club. Forum.

## CONVENTIONS

- Dec. 30-Jan. 1—Chicago, Ill. Twelfth Annual Meeting American Society of Agricultural Engineers. J. W. Dickinson, Secretary, Ohio State University, Columbus.
- Jan. 12-14—New York. Meeting. Society Automotive Engineers.
- Feb. 25-28—New York. Sixteenth Annual Convention. American Road Builders' Assn.

## War Adjustment Committee for M. A. M. A.

NEW YORK, Dec. 15—The Motor and Accessory Manufacturers Assn. has appointed a War Adjustment Committee with full power to act and to establish, if necessary, a Washington office. The committee has been formed to do such work as is necessary for M. A. M. A. members in matters relative to reconstruction policies, and particularly to cancellation of Government contracts. Members of the committee are: Chairman, Charles E. Thompson, president Steel Products Co., Cleveland; Christian Girl, president Standard Parts Co., Cleveland; Alexander W. Copland, president Detroit Gear & Machine Co., Detroit. R. M. McConnell will represent the committee in Washington.

## Simplex Will Be Continued

NEW BRUNSWICK, N. J., Dec. 15—The entire assets and good will of the Simplex Automobile Co. will be placed on public sale at 10 a. m. Dec. 20 by the Wright-Martin Aircraft Corp., which owns and controls the Simplex company. The sale is merely for the purpose of simplifying accounting methods between Wright-Martin and its subsidiaries and does not mean that the Simplex company will cease to exist. Wright-Martin has every intention of continuing the

company as a going concern and is understood to have plans well afoot for a post-war model:

## Army Trucks for Post Office

WASHINGTON, Dec. 15.—Reports to the effect that the Post Office Department has requisitioned 10,000 parcel post trucks for use in the mail service are untrue. Although the Post Office contemplates using this many and possibly more than this number of trucks, it is making its requisitions only as the occasion warrants. The trucks will in all instances be requisitioned from the War Department and will not be purchased from manufacturers owing to the law which orders the War Department to turn over motor trucks to the Post Office for mail service as they are requisitioned.

## Clutches and Controls for Detlaff

DETROIT, Dec. 15—The A. J. Detlaff Co. will hereafter confine its entire plant to the production of clutches and control sets, which have formed a large proportion of its output since its inception, in 1903. For the past year the company has been working on a 100 per cent war basis, building Type B clutches and controls, Type AA clutches and Quad control sets, and is well fitted to continue supplying these parts for the trade.

## Registration Gain in Massachusetts

BOSTON, Dec. 15—Figures compiled by the Massachusetts Highway Commission for the first eleven months of this year relative to the motor registrations, etc., show that the industry in the Bay State weathered the war very well. Instead of a big falling off in the listing of vehicles there was a general gain, when a comparison is made with the same period of 1917. Here are the comparative figures:

	1917	1918	Increase
Cars .....	147,301	160,486	13,175
Trucks .....	26,964	33,011	6,047
Total vehicles ..	174,274	193,497	19,223
Motorcycles .....	11,065	12,862	1,797
Dealers, etc. ....	2,379	2,493	114
Licenses .....	69,487	67,523	-1,964
Renewals .....	144,742	167,312	22,570
Examinations .....	17,336	17,241	-95
Receipts .....	\$1,969,813	\$2,184,408	\$214,595

\*Decrease.

## Selden Declares Dividend

ROCHESTER, N. Y., Dec. 15—At a meeting of the board of directors of the Selden Truck Sales Co., held at the general offices, a dividend of 5 per cent was declared on the first preferred stock, payable Jan. 2, 1919. At the same meeting a quarterly dividend of 2 per cent was also declared payable to stockholders of record as of Jan. 2, 1919. It is stated that shipments during the month ended Dec. 7 were greater by 28 percent than those of any month in the past two years.

# Accomplishments of the Signal Corps

## Need of Purchasing Foreign Planes Early Realized—Plane Production at Rate of Nearly 3000 a Year 6 Months After Declaration of War

WASHINGTON, Dec. 13—That the Signal Corps fully realized the need for purchasing foreign combat planes until the United States was in a position to manufacture its own in sufficient quantities is one of the important points brought out in the annual report of General George O. Squier.

It was just prior to June 30, 1918, that John D. Ryan was appointed to take over this work and head the Bureau of Aircraft Production. A general policy was outlined with the opening of the war which included plans to fill vacancies in Allied flying schools with American cadets, the purchase of all the combat planes from France which could be spared, pending our own production of battleplanes, the establishment of schools and flying fields in this country, the building of training planes in this country, and the building of such types of battleplanes in this country as indicated by the needs of our Army at the front.

Within 6 months from the time war was declared, says the report, advanced training planes were being produced at the rate of 2934 per annum, and in the 7 months from December, 1917, to June, 1918, 910 battleplanes were turned out. The Curtiss JN4-D and the Standard J training planes were adopted with the OX5 and Hall-Scott A-7A engines. These planes were turned out to the number of 1204 up to June, 1918.

In explanation of the expenditures from the \$640,000,000 aviation appropriations, the report states that during the 12 months ended June 30, 1918, \$208,000,000 was expended exclusive of that money spent for training field construction and for operations. The expenditure exclusive of training fields and operations resulted in securing:

- 8,488 airplanes.
- 12,626 engines.
- 911 balloons.
- 115,655 instruments of various kinds.
- 2,717 hangars.
- 379 squadron equipments.
- 317,353 items of aviators' clothing.
- 33,909 items of motor transport.

For training fields and operations \$165,000,000 was expended, making a total expenditure of \$373,000,000 and leaving a balance of \$267,000,000. It was this appropriation of \$640,000,000, it will be remembered, that Congressmen and others claimed had been wastefully dissipated.

The itemized account of the expenditures and production show that Liberty engines were estimated at \$4,400 per unit, Hispano-Suiza 300-hp. engines estimated at \$5,000 per unit, OX5 engines \$2,000 per unit and 80-hp. Le Rhone engines at \$2,100 per unit.

Production of the Liberty engine started in December, 1917, with 22 engines and reached a total of 1102 for the month of June, making a total production up to June 30, 1918, of 2390. Up to the same time, 5474 OX5 engines had been produced. Twelve hundred and four training planes, 397 pursuit planes, 370 artillery planes and 143 bombing planes had been purchased

abroad besides 228 various types of experimental planes.

The JN4 training plane was estimated in the Government contracts at \$4,750 per unit. Also included in the tabulations are motor transport items which show that 7642 motor trucks at \$2,650 each and 3898 passenger cars at \$1,000 each were purchased for the Signal Corps besides numerous trailers, motorcycles and bicycles. Following is the complete report by General Squier:

### Report of the Chief Signal Officer

WAR DEPARTMENT,  
OFFICE OF THE CHIEF SIGNAL OFFICER,  
Washington, Sept. 28, 1918.

SIR: The following report of the operations of the Signal Corps for the fiscal year 1918 is submitted:

The work to May 20, 1918, comprised the development of the Army's aviation program, supply of the Army's telephone, telegraph, radio and annunciator-buzzer systems, supply of its flag, panel and projector and other signaling requirements, its pigeon, motorcycle dispatch, meteorological and time services and the photographic work for the pictorial history of the war.

### Aviation

On May 20, 1918, an executive order created the Division of Military Aeronautics and the Bureau of Aircraft Production, and relieved the Signal Corps of its aviation duties, with the exception of the design and manufacture of all radio apparatus required in the air service. In their annual reports the officers of the new division and bureau will cover their activities, as all aviation personnel, equipment and records have been transferred to them by virtue of the above executive order. Accurate records are available in the new division and bureau created which will enable a minute report of these activities to be prepared at some future time.

It is considered advisable, however, to briefly state some salient facts in this connection which, it is believed, can be safely given at this time.

One of the first steps taken by the Chief Signal Officer at the outbreak of the war was to outline some air program commensurate with the resources of the nation and the importance of the part to be played by our army in the war. It was necessary to have this in sufficient detail to form some estimate which could be presented to Congress as a basis for

<sup>1</sup>Cost plus obligations are included under fixed price column, except for airplanes and engines.<sup>2</sup>Unreported cash disbursements consist of cash in the hands of disbursing officers U. S. A.<sup>3</sup>Sales section, obligations include orders and authorities for materials, etc., purchased by the "Signal Corps" (old) for resale. A portion of this amount.<sup>4</sup>Cash disbursements against sales section, obligations are included under the total withdrawals of I. A. S. C. appropriation.<sup>5</sup>This is an allotment given the "Signal Corps" by the "Navy Department."<sup>6</sup>The total of these two items comprises one appropriation "Signal Service of the Army 1917-18, act June 15, 1917."<sup>7</sup>Includes withdrawals from Treasury for Signal Service part of the appropriation.<sup>8</sup>The total of these two items comprises one appropriation "Signal Service of the Army 1918."<sup>9</sup>Withdrawals from Treasury for Signal Service part of the appropriation included in withdrawals under aeronautical appropriations.

NOTE.—For the fiscal year 1918, the appropriations for both the Signal Corps and Aviation were disbursed from one office in the Bureau of Aircraft Production as a plan agreed to by the Chief Signal Officer of the Army, the Director of Aircraft Production and the Director of Military Aeronautics, which was approved by the Secretary of War. The financial statement therefore covers all of these activities.

appropriations of funds to begin this work. A program was formulated and certain general estimates prepared to inaugurate the work, and in due course Congress appropriated the sum of \$640,000,000 for the purpose. This money became available July 24, 1917.

Due to long years of practical neglect of aeronautics since the Wright Bros. brought out the original flying machine, the outbreak of war found the United States with but a handful of flyers and very few training machines. There was practically no aviation industry in this country, and the number of professional men trained as aeronautical engineers and designers was so small as to be practically negligible. In this respect the problem of developing the air program was unique. The United States had built ships before, had manufactured clothing, built cantonments, guns, ammunitions, etc., and had a splendid body of men trained in these professions; but, outside of a few men, there was no one in the United States with experience in the design or building of even training planes.

How, then, was this problem to be met? Within a few days after the outbreak of war, without proceeding through the regular diplomatic channels, an appeal was made to the military attachés of France, England and Italy to send to this country forthwith the most experienced and trained flyers, aeronautical engineers and designers who could be spared to assist us in this work. As a result, within a very short time, there arrived a number of foreign officers from these countries, who reported for duty officially to the Chief of Staff, and were immediately placed on the working staff of the Chief Signal Officer, directly in his office. Special authority was obtained from Congress to pay the mileage of these officers sent here for duty, and they were utilized in every possible way from the beginning in developing both a system of schools and the matériel required. Simultaneously a strong technical commission was sent to Europe. This policy has been continued to the present day without interruption, and new officers with the latest experience are continually arriving to replace the officers who have finished their tour of duty here. At the same time special designers from England, France and Italy were brought to this country to design machines for the United States; some of them already have produced very promising results. Coincident with this the small group of aeronautical engineers which this country had available were set to work individually on a different type of machine, and some of these machines already have been approved for production.

Within a very few days after the outbreak of war an arrangement was made between the War Department and Canada by which the United States was to receive the designs worked out for flying fields; and in order to hasten the training of our aviators during the construction of our training schools, American cadets were sent to Canada, France and Italy to be trained in their flying schools. In addition to this an arrangement was made by which 10 flying squadrons of the air service were to be trained by the British Government and also equipped with machines and transport complete and ready for service at the front, in exchange for providing flying facilities for the Royal Flying Corps of Canada during the winter months. This resulted in the movement of the Royal Flying Corps establishment to the new fields constructed at Fort Worth, Tex. This exchange also resulted in a tremendous stimulus being given to our own flying schools, which in the meantime had been completed, as it furnished a standard of training in our midst which served as a pacemaker to our own cadets.

For the period of 14 months from the outbreak of the war to the end of May, when the aviation section of the Signal Corps was turned over to the new Division of Military Aeronautics and the Bureau of Aircraft Production, the following table shows briefly the increase effected:

	April 1, 1917	May 31, 1918	Increase (per Cent)
Officers.....	52	16,084	30,930
Enlisted men.....	1,100	147,932	13,440
Civilian employees.....	210	9,838	4,680

It will be seen from the above that the Signal Corps turned over to the Division of Military Aeronautics and the Bureau of Aircraft Production, 16,084 officers and 147,932 enlisted men, and that the increase from April 1, 1917, to the time of this transfer was 31,000 per cent for officers and 13,000 per cent for enlisted men. Of these, there were 7938 officer flyers who successfully graduated from the ground and flying schools, an increase for the period of 15,246 per cent in the commissioned flying personnel. The statement on Personnel Data gives the details of these increases. There were 167 deaths due to flying accidents of the year in the United States, or one to every 147,840 miles of recorded flight, a lower ratio of deaths than that of our allies.

In reporting upon the accomplishments of the year it must not be overlooked that the greatest thing done, in a fundamental way, was the creation of an industry capable of supplying the needs of the future for aircraft and aircraft accessories, there being now engaged in this work about 350 concerns, employing an industrial army of 200,000 men and women. This accomplishment is all the greater when it is realized that everything pertaining to aircraft equipment is of a highly technical nature, extremely difficult to produce.

**Matériel.**—When the United States entered the war, it was evident that the time was fast approaching when the reservoirs of raw material for the allies were to be found only in the United States and that America's effort should be so organized from the beginning as to furnish a continuous flow of this necessary raw material, not only for our own program but for those of our allies as well. In other words it was clear that the spruce, the fabric, the dope and the oil must be produced as a part of our program on a scale to supply also the air programs of our allies.

Manifestly, therefore, each step made in the beginning must be made with a view to our allies as well, and no policy must be restricted to the United States alone. Just as our land units were later assigned to English and French units so must our materials be freely pooled and assigned to our allies as well as ourselves. The closest co-operation was established, therefore, with our allies in determining the scope of America's efforts. In addition, the needs of our own navy and the navy of Great Britain also were included in the army's program for furnishing these essentials.

One of the serious mistakes which the allies had fallen into at the time the United States entered the war was the development of a multiplicity of types of engines and planes which made it impossible to have a large number of any one of these types. As a further consequence, the trained personnel on the ground to operate and repair the machines had grown to such a proportion that it was estimated from 30 to 50 men were required on the ground to keep each one of the many types of planes in the air on the fighting line. Manifestly, unless this large number of trained men per fighting plane could be reduced by some means it would be hopeless to expect within a reasonable time to put into the air thousands of flying planes, because a single thousand planes on this basis would require from 30,000 to 50,000 men in attendance.

Common sense, therefore, dictated the following general policy, which was followed:

(a) To fill up all vacancies in allied flying schools with the maximum number which could be accommodated, to gain time in training our flyers while our schools were being built. This was done to the limit which could be accepted by each of the allied governments in Canada, Italy, England and France.

(b) To purchase from France all the combat planes which the French could possibly spare from their own needs, for delivery at the earliest moment, to supply our forces overseas, pending the time our own production of battle planes could be developed. This was done, and, furthermore, raw materials and even mechanics to help make these planes were furnished by the United States, and at the present time satisfactory deliveries are being made on these contracts entered into early in the war.

(c) To establish schools and build flying fields for training aviators in this country.

(d) To provide training planes to train aviators in this country.

(e) To build such types of battle planes in this country as the needs of our army at the front should indicate, and supply such additional aviation equipment as was required for overseas use.

The accomplishment following these policies is best shown by referring to the statements, Aviation Equipment Production and Personnel Data, which form a part of this report. The former shows month by month the actual deliveries of aviation equipment from July 1, 1917, to June 30, 1918, and the latter the monthly personnel increases for the same period.

The following comments refer to the data contained in the statement, Equipment Production:

**Primary Training Planes.**—Obviously, the first task was to provide an adequate number of training planes for our cadets. The Curtiss JN4-D and the Standard J types were selected and passed upon by the Joint Army and Navy Technical Board as the two available planes then in this country. In the quantity production of completed planes the limiting factor is the production of engines. The OX5 engine and Hall-Scott A-7A were the only two available engines, and the Standard J, while not the equal of the JN4-D plane, was approved by the said Joint Army and Navy Board because it would accommodate the Hall-Scott A-7A engine until such

time as the production of the Curtiss OX5 engines could be increased. The production of primary training planes was within six months fully adequate to the needs of the service.

**Advanced Training Planes.**—After the production of primary training planes was secured, and it was necessary to develop planes for advanced training, and within six months these planes were being produced at the rate of 3924 per annum.

**Battle Planes and Engines.**—In the development of battle planes the first problem to be solved was that of the engine. Common sense required that the most approved types of European engines which could be made in this country should be ordered. This was done, the first large contract for Hispano-Suiza engines being given July 30, 1917, while the first contract for Liberty engines was not let until Sept. 4 of that year. By the end of May, 1918, more than 2000 of these foreign motors had been produced by American factories. It was early apparent, however, that the tendency was toward greater horsepower than was being developed by any approved foreign engine. Consequently, coincident with the production of such approved types of foreign engines as were available for production in this country, a new engine, late known as the Liberty engine, was developed and placed in production. While the production of this engine at the end of May, 1918, was not as great as the production of the approved types of foreign engines which had been earlier arranged for, nevertheless, the wisdom of this course is becoming daily more apparent, since the foreign types produced here, although used by our allies on the Western Front, are not thought to be of sufficient horsepower to put in planes for overseas shipment, and the Liberty engine has become the main reliance of our battle program. It has proved satisfactory not only to our own Army and Navy, but to the air services of our allies as well. It is not an invention, but stands as the accomplishment of American adaptability and foresight. The development of the Liberty motor was required by the logic of the situation, which the event has proved to have been correctly estimated. The production of battle planes had necessarily to follow the production of engines. The best aeronautical talent available in this country was employed to that end. The assistance of Mr. Orville Wright, at Dayton, Ohio, has been of great value, but necessarily the accomplishment in this field must be due to the hearty and loyal co-operation of the representatives of the allies. This we received in the fullest measure and their able and generous assistance was utilized to the utmost.

**Overseas Plane Production.**—Out of the appropriation available our allies produced in their factories the following planes for American units:

	Training	Battle
1917		
December.....	394	5
1918		
January.....	196	4
February.....	233	90
March.....	130	98
April.....	122	90
May.....	11	290
June.....	118	315
Total.....	1,204	910

**Balloons.**—The supply and equipment of the balloon organizations have been adequate to the service.

**Machine Guns.**—While this office was responsible for obtaining the armament, ammunition and bombs required out of the available appropriation, the same was done through the Chief of Ordnance. These articles are being delivered in sufficient quantities.

**Raw Materials.**—Due to the fact that there was at the beginning of the war practically no airplane industry in this country, there was an inadequate supply of nearly all raw materials necessary in their construction. A broad foundation had to be laid in this regard to meet not only our own requirements, but those of the allies, who were coming to depend more and more upon this country. The production of spruce had to be tremendously increased, necessitating the building of mills, railroads and other equipment. As it was impossible to produce the millions of yards of linen fabric required a suitable cotton substitute was developed which is now being manufactured in this country in quantities sufficient to meet the needs of both America and her allies. This accomplishment, heretofore thought to be impossible, ranks among achievements of the first importance. The dope which is used on the fabric of airplanes presented many difficulties not only to us but to our allies. This and other

Percentage forgings, finished, semi-finished, and raw materials, costing about \$9,000,000, weighing over 23,000 tons, actually freighted on steamers to allies account American plane production.....						14	15	17	12	9	17	3	4	5	96
Dollars actually spent during the month, in thousands (from accounts current).....		\$1,127	\$7,980	\$255	\$6,065	\$13,626	\$23,467	\$39,151	\$35,193	\$28,797	\$34,384	\$39,209	\$45,267	\$45,266	\$321,784

chemicals required are now being produced in this country in sufficient quantities for their requirements as well as our own. There was a great deficiency in the production of castor oil. This necessitated the planting of over 108,000 acres of castor bean plants as well as the establishment of the necessary crushing plants and refineries. It is thought that this problem has been solved.

**Instruments.**—It will be noted in the statement, Aviation Production Equipment, that there were about 20 types of instruments developed and in production to June 30, 1918, as necessary to give airplanes, pilots and observers the greatest possible usefulness. It may be said that the making of these instruments is a new industry for America. Their production must keep abreast of the battle-plane production, as such planes without them are useless for battle purposes.

**Expenditures.**—During the 12 months ended June 30, 1918, there was expended a total of about \$373,000,000. From this should be deducted approximately \$165,000,000 spent for completing training fields and for training and operation purposes in this country and abroad. This leaves a balance of about \$208,000,000 expended in obtaining these items:

Airplanes.....	8,488
Engines.....	12,626
Balloons.....	411
Instruments of various kinds.....	115,655
Hangars.....	2,717
Squadron equipments.....	379
Items of aviators' clothing.....	317,353
Items of motor transport.....	33,909

In addition to this it should be remembered that the expenditure of this sum does not bear a direct relation to the cost of the articles produced, for the reason that much of it is locked up in inventories of uncompleted articles and in facilities for production which will ultimately reduce the cost of additional articles. Out of the appropriation of \$640,000,000 there was then a balance of approximately \$267,000,000 unexpended, which should in time produce the estimates of material upon which the original program was based.

**Summary.**—It is unnecessary to repeat the story of the Liberty engine, although many of the details are yet to be told. The whole conception of a standardized American engine, utilizing the special American genius for quantity production, for service not only in the program of the United States but for universal service for all of the allies, was a national undertaking which, for daring and farsightedness, it

Funds available:	
Act May 12, 1917.....	\$10,800,000.00
Act June 15, 1917.....	31,846,067.16
Act July 24, 1917.....	640,000,000.00
	682,646,067.16
Disbursements to June 30, 1918.....	378,318,388.64
To balance.....	309,327,678.52

is believed, will be an increasing cause of pride for the American people. On Oct. 12, 1918, the completion of the 10,000th Liberty engine was celebrated in Detroit. There is no possible yardstick to measure the present and potential value of the Liberty engine. It cannot be measured by any money standard. One has only to consider what would be the result at this moment of subtracting from the allied air programs the Liberty engines as a whole to obtain some idea of this accomplishment.

The American-made DeHaviland battleplane, modified to receive the Liberty engine, is at the moment recognized as one of the best battleplanes anywhere on the Western Front, and the delivery of these planes in France has already overtaken for the moment the creation of the necessary facilities and personnel for their use.

The development of a fabric which can be furnished by America in required quantities and at price slightly over half that of the formerly used linen fabric, of which there was a limited supply, is another achievement of American ingenuity and enterprise.

The creation of special radio apparatus, the details of which cannot be mentioned here, permitting new control of the operations of airplanes en masse, is another contribution to the credit of American engineers and American manufacturers.

In short, it was always the general allied cause which controlled the decisions in founding this industry, rather than the needs of the United States alone, and this is obviously the only correct point of view. After four years of war, in which the United States entered but a year and a half ago, the allies are depending largely upon America, to a greater and greater degree as the days pass, for the castor oil for their engines, the fabric to cover the planes and the dope with which to treat the fabric, the spruce and fir to make their planes, and the engines to propel them.

GEORGE O. SQUIER,  
THE SECRETARY OF WAR. Major General, Chief Signal Officer.

### Hudson Wants Some New Dealers

*A Rare Opportunity is Offered in Connection with the Hudson this Year. Dealers Will Do Well to Investigate.*

Hudson Distributers are now prepared to disclose interesting details concerning the money-making opportunities that go with the Hudson line this year.

The Super Six has been one of the most profitable and easiest-selling cars on the market. The production, while larger than that of any other fine car, has not permitted the extension of the territory beyond certain limits. Its dealers have taken the leading position in their respective communities. They have prospered, as every automobile dealer knows.

This year we are embarking upon an enlarged program. The opportunities are even greater than they have been in the past.

New territories will be developed. Some new dealers will be named in localities where the representation in the past has not come up to Hudson standard.

If you are interested in knowing what Hudson offers this year, we suggest that you immediately get in touch with the Hudson Distributer in your territory, or that you write us for further information.

# UTILITY

## Automotive Products

### Utility Heaters Sell Readily

and are easily installed on any car. And they make satisfactory customers who will buy other Utility products from the dealer.

UTILITY heaters are in greater demand than ever this winter. Motorists have resolved to be comfortable since they know a UTILITY heater costs nothing after it's installed.

If you haven't ordered one or more UTILITY heaters do so today. Unusual demand and delayed shipments may make them hard to get later.

## **Political Plan of Organization Satisfactory**

### **For Relatively Small Establishments**

#### **Combined Work of Employees' Representatives and Supervisors' Committee Suggests Added Values—A Typical Method Reviewed**

By Harry Tipper

**I**N all organizations gathered together for common purposes it is necessary that certain disciplinary measures be agreed upon as a basis for the organization. In order that the group may operate together it is necessary that for certain specific causes the right of discharge should be maintained without review.

For this reason practically all the legislative organizations which have been adopted by various individual concerns have stated in the agreement that the right of discharge is not changed by the formation of the organization and that for certain causes varying to some extent with the necessities of the work immediate discharge without review is the result.

#### **Causes for Immediate Discharge**

In an oil company the carrying of matches onto the refinery premises contrary to the fire rules and the necessary safety may constitute a reason for immediate discharge without review where such an item would not be an infraction of the rules in other lines of business.

In general, the causes for which an immediate discharge without review is retained in the preamble agreement to these organization developments group themselves under three heads:

1—Those disciplinary measures required by law. In general this is stated in so many words in the agreement between the employer and the employee requiring an obedience to all regulations prescribed by the State and

national laws governing the working conditions in the industry affected. This, of course, is absolutely necessary not only that the legal requirements may be fulfilled but in order to provide a basis for the observance by the individual employees of any regulation which may be imposed by the legislative organization within the industrial unit. It is obvious that the basis for orderly agreement within the industrial unit must be a strict observance of the regulations imposed by the political government of which all industrial units are a part.

2—Those measures demanded by the insurance companies and other bodies as a corollary to protection against damage. These regulations come in the same category as the legal restrictions previously mentioned, but they are usually stated specifically so that they may be thoroughly understood by the employees and their observance agreed upon in the case of each particular rule.

3—The third division included in the causes for immediate discharge without review is peculiar to the industry in which the unit is engaged and in some cases peculiar to the organization. In it are present those items which in the opinion of the governors of the industrial unit and the representatives of the employees are sufficiently serious to eliminate the man as a useful member of the industrial organization and therefore unworthy of any reconsideration.

This point is quite important, as it is obvious that a

constant review of cases which relate to infractions of rules which are for the general benefit of the body of workers and the operations of the industry, loading the committees with the necessity for examination of matters so obviously detrimental would work a constant hardship on the orderly part of the organization and result in a reduction of the benefits to be derived as well as a lack of operating discipline.

The example organization plan which we are considering in this article has been picked out because it has been used in several cases of organizations involving a small number of employees where the difficulties of meeting are not so severe and where the operations of the legislative organization can be handled from the point of view of closer contact and understanding.

As in most of the new forms of organization, this example follows the political organization as it is represented in the arrangement of Congress. It follows the lines, however, much more closely than some of the organizations which have been adopted in the machinery business, and it is of much longer standing.

The original organization plans were made in 1914. They have been running for nearly 4 years. This is important in considering the value of the plans, as time must be allowed for the shaping together of such an organization before it will fulfill properly all the functions for which it has been created.

The general plan of this organization exactly parallels the political organization of the United States, consisting as it does of a House of Representatives taken from the body of general employees by election, a Senate representing those salaried employees who are in charge of the execution of the plans of the company, and the supervision of departments, and a Cabinet representing the officers of the firm and the general executives.

In fact, it goes further in this direction in that it calls for a joint standing committee appointed by the House and the Senate to act in a similar way to the conference committees of the House and Senate of the United States in bringing an agreement upon matters of importance before they are submitted to the Cabinet.

The only difference between the organization for legislative purposes in this company and the political organization under which we all live is the lack of provision for the carrying of a regulation or policy over the veto of the Cabinet. But in practice this is not very important, as the combined agreement of the House and Senate upon a matter has been accepted as usual practice and put into operation by the Cabinet.

There is one example in this country of a legislative organization in a business which provides for the carrying into the operations of the company of a policy agreed upon by a two-thirds majority over the veto of the board of directors, and in the case of this one example the lodgment of that much power in the hands of the employees

has been highly successful. However, it is hardly necessary that this should be followed in the present state of industrial organization and it should grow out of the workings and values of the organization rather than be included in the plan which is stated.

There are a number of points which should be called to the attention of the man who is interested in labor developments in this type of organization. It has been used mainly in organizations of a smaller size carrying on the payrolls less than 1000 workers, and some of its provisions would not be applicable to organizations of a much larger character. It has been used also where the turnover is not quite so large as the usual percentage to be observed in the machinery industries and where the permanence of the employees has resulted in an agreement and a co-ordination that will be impossible for a long time in the machinery industries where the turnover is so large.

### Election of Members

To be eligible for election to the House of Representatives an employee must have been in the employ of the company continuously for at least 6 months. An indication of the permanence of employment in this business is to be found in the fact that over four-fifths of the employees are eligible for election.

It is to be noted that every department of the company is privileged to elect one representative no matter how small a department may be. This is a significant departure from the plans which have been presented so far emanating from the machinery and metal industry, where the election of representatives is determined by the plant or geographical location and not by departments.

One representative is allowed for each fifteen employees in a department. The small number of employees to each representative is, of course, governed by the smaller size of the establishment and has no particular bearing upon the success of the scheme.

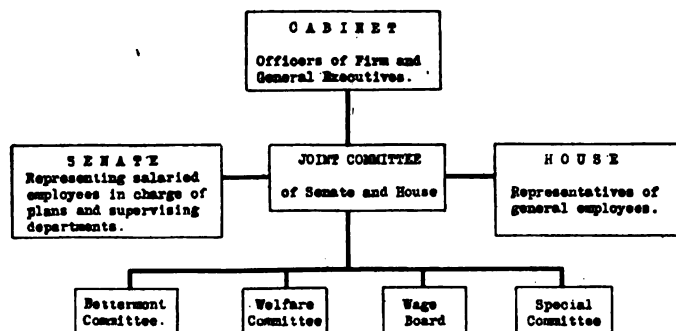

The procedure in developing the Senate is quite different. There is no election in this case, but an appointment by the members of the Senate by a majority vote after the applicant has secured the endorsement of the firm and not less than one member of the Senate. The Senate, in other words, represents the detailed operating supervision of the organization, and its value arises out of its familiarity with the necessities and conditions in each department and not out of the fact that it consists of employees. All members of the Senate having charge of plans and supervision are representatives of the officers, equipped, however, with a much more intimate knowledge of the necessities and the conditions.

This provision of the Senate as a standing body is an extension of the conference system among department heads so as to bring it into co-ordination with the House of Representatives as a part of the legislative machinery. It will be noted that here again there is a definite departure from the practice as outlined in the plans of the machinery and metal organizations which have been created during the last 3 years.

Of course it is true that in most of these large concerns in the machinery and metal fields the conference and committee system between heads of departments is a regular part of the business procedure, but so far as we have been able to observe it has not been co-ordinated definitely with the other machinery as a part of the legislative organization.

It seems as though the knowledge of those supervisors who are handling the detail operations of the various departments of a manufacturing organization would be able with their knowledge of the intimate conditions to

(Continued on page 1088)

*Co-operative organization for legislative and judicial functions*

# S. W. H. Tractor a New Cleveland Product

A 3-Plow Machine with Pressed Steel Semi-Frame Bolted to Front End of Transmission Housing—Engine and Transmission Independent, Insuring Accessibility

*Accessibility is a feature of the new S. W. H. 3-plow tractor. About 30 per cent of the weight rests on the front wheels*

**D**URING the past year a striking departure has been made in tractor development. Very few of the newer tractors have the channel steel frames, built-up front axle and other remnants of the experimental period of tractor history. In fact, the later models show much evidence of careful design and are less indicative of attempts to produce something strikingly original. Smoothness of lines and protection of all working parts against dust, etc., have become more marked features.

A new tractor of strictly modern lines has just been announced by the S. W. H. Engineering Co., Cleveland, Ohio. It is a 3-plow tractor of the four-wheel type, and we are informed that its design was laid down only after a careful study of what farmers actually require of a tractor and what others had done to produce a machine to meet these requirements.

## Novel Frame Construction

One of the most interesting features of the S. W. H. tractor is its frame construction. The housing for the transmission and rear axle is a single casting. The rear axle shafts extend through this housing at the rear, and are supported in bearings carried in cast iron extensions bolted to the housing on both sides. The front end of the transmission case is machined off flat, and to the faced surface thus formed is bolted the rear end of the frame. As the rear end of the frame members is of very deep section, this makes a very rigid construction. The frame supports the engine, radiator and other minor parts. Near its forward end there is a cross member to the center of which are riveted two brackets, forming a swivel support of the front end of the frame on the front spring. As a result of this swivel support of the forward end

of the tractor, the wheels can accommodate themselves perfectly to any unevenness of the ground, and the spring support protects the forward end of the tractor against undue shocks and jars. About 30 per cent of the total weight of the tractor rests on the front wheels, and the frame members were designed to take care of this load. To combine lightness with strength, the frame members are made up of 3/16 in.

*The S. W. H. engine is of stock type, designed to use kerosene*

*A novel form of frame construction is employed*

pressed steel, the section tapering from the forward to the rear end. Owing to the low depth of the frame members at the forward end the steering lock is not unduly restricted. We understand that a patent on this frame construction has been applied for.

#### Engine a Stock Type

The engine is a special heavy duty tractor type, designed to burn kerosene. It is a four-cylinder engine of 4½ in. bore by 6 in. stroke, and is of the valve-in-head type. All moving parts are inclosed. There is pressure feed lubrication to the main and connecting-rod bearings and all other parts are lubricated by splash. The crankshaft is of large diameter, and is carried in bronze-backed, babbitt-lined bearings. Ignition is by a high tension magneto with impulse starter. The carbureter—a Stromberg plain tube type—is located as close to the engine as practicable, and all the air drawn in is first passed through an air cleaner so as to remove all particles of dust and grit. Fuel feed is by gravity. A supply of 30 gal. kerosene is carried and in addition 3 gal. of gasoline. The engine is of the open flywheel type, which permits of ready access to the clutch and even of the removal of same without

disturbing any other part. On the forward part of the engine is carried a 21-in. radiator fan, which is driven by a wide flat belt.

An integrally built governor of the fly-ball type maintains the engine speed at 900 r.p.m., at which speed the engine develops approximately 37 hp. The governor is completely enclosed, and is said to be very sensitive, governing the engine speed within very close limits. An oil pressure gage is mounted on the rear of the fuel tank, where it can at all times be readily seen by the operator, and indicates the pressure under which the oil is fed to the bearings. This pressure normally is about 30 lb. per sq. in.

#### Thermostat and Motometer

Special attention has been given to the design of the cooling system. The tractor is equipped with a Modine spirex radiator, having a core measuring approximately 22 by 23 in. The shell of the radiator is an integral iron casting, and has the core secured to it by 8 cap screws, so that after taking out these screws the core may be removed from the shell. The radiator is provided with a large filler spout with quick opening cap and motometer. To the back of the radiator is fitted a hood or shroud, in which turns the 21 in. fan, the provision of this hood tending to increase the efficiency of air circulation through the radiator. The water is circulated by means of a centrifugal pump, and a thermostat is installed to regulate the temperature of the cooling water in the engine jacket. Maintaining the engine cylinders at a uniform high temperature, not only increases the efficiency, but also tends to facilitate the burning of kerosene.

The clutch used is a Borg & Beck dry plate type, 12 in. in diameter, and is carried directly in the flywheel of the engine. By reason of the special frame construction, this clutch can be removed without disturbing the engine or transmission. Between the clutch tail shaft and the transmission primary shaft is incorporated a Thermoid three-disk flexible coupling. The disks of this coupling are of Sea Island patent fabric, and rubber. They are 5/16 in. thick and 8 in. in diameter, and they furnish a very strong flexible connection between clutch and transmission. Not the least advantage of this flexible coupling is that it materially relieves shocks in case the clutch grabs or the load on the tractor suddenly increases by the plow striking rocks, stumps, etc.

#### Rear Axle and Transmission One Unit

The rear axle and transmission form a single unit. The transmission is of the inclosed, spur gear type, and all shafts are mounted on anti-friction bearings, both Hyatt roller and ball bearings being used. All gears are cut and heat treated, and are fitted to splined sections of the shafts. The gearing within the transmission housing affords two forward speeds and one reverse. However, on the outside of the housing there is a pair of gear wheels, under a quick removable cover, which can be interchanged in order to obtain a smaller reduction to the rear wheels. With the standard set of gears (28:34) the reduction ratio from the engine to the rear wheels on low speed is 54.5:1, which corresponds to a tractor speed of 2 1/3 m.p.h., while the reduction ratio on the high gear is 37:1, which corresponds to 3½ m.p.h. If the cover over the outside pair of gears is removed, and these gears are interchanged, the low speed reduction will be reduced in such a way as to give a tractor low speed of 3½ m.p.h. and a high speed of 5½ m.p.h. It is thus possible by means of the interchangeable set of outside gears to get a speed range of from 1½ to 9 m.p.h. The regular plowing speed is 2 1/3 m.p.h., which is obtained at an engine speed of 900 r.p.m. There is said to be a marked tendency toward higher plowing speeds, and this tractor will make such speeds available as soon as the moldboard plow is adapted for operating at higher speeds. At 2 1/3 m.p.h. the tractor develops maximum drawbar pull of 3500 lb. and a sustained drawbar pull of 3000 lb., and at 3½ m.p.h., the sustained drawbar pull is 2000 lb.

#### Power Take-Off

The belt pulley, which is 18 in. in diameter with 6½ in. face, is driven through a pair of bevel gears, and is controlled by the same friction clutch as the drive to the rear wheels. It turns at 550 r.p.m., which corresponds to 2600 ft. per min.

belt speed. A sliding gear renders the power take-off inoperative when the tractor is in motion. The differential used is of the same dimensions as that of the Class B standard war trucks. A contracting brake is fitted to the differential, to permit of holding the tractor on bad hills and of locking it in position while doing belt work.

The rear axle drive shafts are 3 in. in diameter, and are machined with a long taper to which the wheels are fitted. A rather unconventional type of drawbar is provided. This is made of flat bar stock, bent up yoke-shape, and is secured to opposite ends of the axle housing. It is braced at the corners to insure the necessary rigidity. In addition to serving as a drawbar, this piece serves also as a step for the operator. The height of the hitch from the ground is 17 in., in accordance with the S. A. E. standard, and the drawbar has a lateral adjustment of 24 in.

The front axle, which is of the company's own design, is a steel drop forging of I beam section, heat treated. The steering knuckles are also drop forgings, and are provided with renewable bushings through which pass the hardened and ground steering pins. The weight of the machine is transmitted to the front wheels through liberal sized thrust bearings on top of the steering knuckles, inclosed so that they will always be submerged in oil. The tie-rod is tubular, of large diameter, and carried back of the axle, where it is protected against injury. The clevises at both ends of this rod are fitted with hardened and ground pins, turning in removable bushings inserted in the end of the steering arms.

#### Front End Spring-Mounted

A half elliptic cross spring, 35½ in. long by 2 in. wide, supports the forward end of the tractor on the front axle. This spring is located directly above the axle, its right-hand end being connected to the axle by means of a spring bolt and two plates, and the other end swinging on shackles links. Self lubricating bushings are fitted in the spring eyes and in the hole in the front axle. The spring is made comparatively long in order to apply the weight to the axle as near the wheels as possible, and thus reduce the bending moment on the axle. A hole is drilled near each end of the axle to receive the wishbone type of radius rod construction. These radius rods are tubular and are provided with forged connectors at the forward end, secured into the axle. At their rear end the two tubes connect to a single forging, which is formed with a ball of 2 in. diameter, this ball being supported in a socket secured to a cross member of the frame. Thus the front construction is absolutely free to accommodate itself to uneven roads.

The second cross member from the front end is an inverted channel section and has riveted to it the bracket for the front spring. The second cross member from the rear is of deep channel section and has the spherical socket for the triangular radius rod riveted to it. The center line of the front spring hinge pin produced passes through the center of the ball, thus insuring a high degree of flexibility. This cross member is connected with the rear cross member by a central channel piece so that the thrust on the front axle is taken directly against the front end of the transmission case. Just back of the second rear cross member the frame tapers toward the center slightly and the rear end of the frame is composed of a large plate, the upper and lower edges of which are flanged over so as to form a channel and the two ends attached to the frame are also flanged and riveted rigidly to the side rails. Two gussets brace the upper flange of this cross member to the frame side rails and a continuous flat plate forms a gusset between the second rear cross member, the frame sides and the back member. Suitable additional reinforcements are used in the corners of the rear plate.

#### Connection Between Frame and Transmission

The rear plate of the frame is drilled to take ten ¾-in. cap screws, and the frame is bolted directly to the front face of the transmission. The whole design of this frame is such as to insure great rigidity while at the same time it is light.

Front wheels of 30 in. diameter and 6 in. width of face are fitted, these wheels having rims ¾ in. thick. A mud band of 1 in. square cross section is shrunk over the rims of these wheels at their middle in order to insure more positive steering. The hubs are malleable castings, and are bored out to

*A semi-elliptic cross spring supports the forward*

*Rear axle and transmission form a unit. Transmission is enclosed*

take removable Hyatt liners. Each front wheel is mounted on two Hyatt roller bearings, and the thrust is taken on thrust washers of large diameter, care being given inclosure of these bearings so as to exclude dust and lubricant. Flat spokes are used.

The rear wheels are also of the flat spoke type, the hubs being riveted to rolled and flanged steel rims, 48 in. in diameter with 12 in. face and ¼ in. thickness. The hubs are malleable iron. The rear wheels are secured to the axle shafts by means of taper, key and nut. The rear wheels are punched to take either grousers or angle cleats, ever is most suitable for the condition of the ground on the tractor is to work.

#### Control Details

In view of the fact that tractors often must be operated by boys and women, the designer of the S. W. H. tractor

made special endeavor to render the control easy. All of the control members are centralized so that they can be easily reached from the driver's seat. A wide flat spring, secured to the rear end of the transmission case, carries the driver's seat. It is provided with a safety leaf and a rebound clip. The steering post, which is supported by a triangular bracket on the transmission case, is very strongly inclined, and has secured to it a 17 in. diameter steering wheel with wood rim. Spark and throttle control levers are mounted directly underneath the steering wheel, on the steering post bracket, and are operated by the right hand. The brake in the transmission is operated by a lever within easy reach of the operator's right hand. The clutch throwout treadle runs entirely around the rear of the transmission case, and may be actuated by either foot. The gear shift lever is located slightly to the

left of the steering wheel, and is operated by the left hand. It operates in a control gate or quadrant which has the different positions marked upon it. When the tractor is at rest, the lever is in the neutral position, and in order to pick up one of the speeds, all that is necessary is to slide the lever forward or back, to register with the correct slot, then to swing it toward the center of the tractor.

The S. W. H. tractor has a wheel base of 90 in., a tread at the front wheels of 56 in. and a tread at the rear wheels of 52½ in. Its overall dimensions are as follows: Width, 64½ in.; length, 12 ft. 2 in.; height, 5 ft. 6 in. The minimum ground clearance is 13 in., and the weight of the tractor without lugs, water or oil, is 4525 lb. The spade lugs weigh about 100 lb. per wheel, so the tractor as shown in the illustration weighs about 4725 lb.

## Political Plan of Organization Satisfactory

(Continued from page 1084)

arrive at an agreement with the employees' representatives so that the matter submitted to the Cabinet would represent not merely a demand from the employees but an agreement between all those immediately concerned with the matters discussed.

Under this plan it would seem that the time of the general executives and the officers of the company could be conserved that the agreements would be arrived at more rapidly, a great many matters disposed of without reaching the heads of the institution and in addition the minor executives would be trained thoroughly in the methods of handling human relations in industry to the great advantage of the whole institution.

It will be noted also that in this plan the jurisdiction of the House and Senate is not restricted to the discussion of certain matters but that it may consider any matters that affect the interests of the employees or the concern. This has, of course, its disadvantages as well as its advantages.

If the organization were not functioning properly a great deal of time might be wasted by the discussion of matters which would be impossible of solution and the intrusion in affairs which concerned the operations and not the legislation of the business.

On the other hand, the agreement between the employees and the supervisors through the medium of the machinery provided in this way might be carried much further and conduce to a much greater degree of understanding without the limitations which are usually imposed upon the business of such bodies.

In actual practice it has developed that in the course of the 3 or 4 years the members of both bodies have come together sufficiently in their understanding of the value of these bodies and their use of the machinery so that their discussions are devoted to things which are pertinent and their agreements have been valuable to the business.

The judicial procedure in the review of complaints carries a complaint to a sub-committee of a joint conference committee consisting of an equal number of representatives from the House and the Senate which reviews the case and makes a decision. If this review is not satisfactory to the employee he may appeal to the House and Senate which then appoint a special board for the purpose of acting upon the case, this board consisting of two members of both houses and a fifth brought in by mutual consent. The decision of this board is final. It may reinstate, it may discharge, but there is no appeal from its decision.

The writer has been struck with the number of ap-

peals which are allowed in the judicial procedure of some of the co-operative organizations developed. It is not wise that individual grievances should be permitted to pass through a judicial process which may defer the final action for a long period of time. Neither is it wise that employees should be able to appeal from one court to another on insignificant and ridiculous pretext because of some dissatisfaction with the result.

It looks as though one review and one appeal should enable most cases to be judged fairly and disposed of justly, besides accelerating the decision so that the final action can be taken within a reasonable period and the employee notified of the results in his case.

This is a very important point as there is a possibility of a great deal of dissatisfaction in the adjustment of personal grievances and the dissatisfaction can be vastly increased by the length of time through which it is possible to appeal a matter from one body to another.

In the interests of both supervisor and employee the procedure should be as just as possible and also as rapid, and its limitation of the judicial procedure to two boards of review and decision is recommended to the reader's attention as a suggestion of advantage in the development of this type of organization.

In these cases where plans have been in operation for several years it is possible to measure the value of their actions to a degree which would not be possible in the case of the newer developments in this respect. There is considerable detailed information as to the action of these organizations upon wages, upon hours, holidays, etc., which will make it possible to determine the success with which they have attacked some of the problems. The consideration of these items will therefore be left over to the next article.

## Production of Rubber in Fiji Islands

ACCORDING to a published statement of His Majesty's Trade Commissioner to New Zealand, who has lately visited the Fiji Islands, the rubber industry is receiving much attention in those islands, and New Zealand farmers have planted large plantations there that have produced quantities of rubber reported to be of a very high grade. It is claimed that there are thousands of acres in the Fiji Islands that are well adapted to this industry, and it is expected that extensive developments will follow. The price of rubber at present seems very low, since the market is so greatly restricted because of the war, but it is expected when normal conditions are restored that this will become a profitable industry in these islands, where labor is comparatively cheap.

# Electrical System of the Liberty Engine

Generator and Battery Supply the Current for Ignition—Special Type of Interrupter Used Comprising Three Breakers in Parallel—Storage Battery Designed to Permit of Upside-Down Flying

By J. Edward Schipper

ONE of the most interesting engineering problems that had to be dealt with in working out the details for the Liberty aircraft engine was that of the electrical system. After much discussion it was decided to use the generator-battery type of ignition. A special design of the Delco system was produced, which has given excellent satisfaction and which incorporates ingenious features which may eventually prove to be of use in commercial fields.

The system consists of a low-voltage generator, a voltage regulator, an extremely light-weight battery, a double distributor system, duplex switch, and the various units necessary for the control of the apparatus. Referring to the previous article on the Liberty engines, which appeared in *AUTOMOTIVE INDUSTRIES* of December 12, the generator is driven from the vertical shaft which also drives the oil and water pumps. The regulator is so designed that it keeps the voltage between 10 and 10½ volts. The generator operates in conjunction with a special light-weight Willard or Exide 8-volt battery which supplies electrical energy for starting and while idling at low speed. Above 650 r.p.m. of the engine the generator supplies all the cur-

rent required for ignition and charges the battery.

The ignition system is double, there being two spark plugs in each cylinder, as well as duplicate distributors, which latter are mounted upon the camshaft housing of the engine and driven directly from the camshaft. The two distributors are ingeniously synchronized. Each cylinder receives sparks from both distributors, the right hand distributor supplying the plug nearest the distributor and the left-hand distributor the plug nearest the propeller.

The current is controlled through a duplex switch. Either switch lever, when used alone, causes the battery to supply the ignition current. When both switches are turned the generator is automatically connected in circuit. As the generator does not furnish sufficient current to carry the ignition load, when the engine is running at less than 650 r.p.m., it is not advisable to turn both switches on at such speeds, since this causes the battery to discharge through the generator. Thus, starting is accomplished by turning one switch handle, and when the engine is running at above 650 r.p.m. the second switch lever is turned to the "on" position, so that the current will then flow from the generator. An ammeter is incorporated in the switch assembly.

Combination switch and ammeter

Voltage regulator back of switch

Sectional 1

Two outside views of ignition unit

The generator is a four-pole, shunt-wound unit, mounted vertically on the engine crankcase. It is directly driven at  $1\frac{1}{2}$  times crankshaft speed. As indicated by the sectional view, the tachometer drive is incorporated in the generator base, being secured by means of a worm gear off the armature shaft.

The voltage regulator controls the generator field current through the magnetically operated regulator contact points. This regulator is usually mounted on the dash directly behind the switch and is connected in circuit as shown in the diagram herewith.

Probably the most interesting unit in the entire system is the breaker-distributor. Two distributors, each operated by the camshaft as described, provide each cylinder with two independent and simultaneous sparks at the duplicate plugs. The distributors are interchangeable and each distributor incorporates both an ignition coil, sealed in the Bakelite head, and the breaker mechanism. The timing range is 40 deg.—30 deg. advance and 10 deg. retard—measured on the crankshaft circle.

Both breaker mechanisms are operated by cams having twelve lobes, or one lobe per cylinder. The cam operates pivoted contact arms which close and open the low voltage circuit at the proper instant for firing. The unusual features of the breaker mechanism are the two main contact arms, each performing the same function at the same time for reliability, and, as a safety feature, an auxiliary contact arm which prevents the engine from operating in the reverse direction.

An illustration is given showing the arrangement of the two main contact arms and the auxiliary contact. The auxiliary contact arm is so set that when the engine is running ahead the auxiliary contact points break before the main contact points, so that the action of the auxiliary contact points has no effect whatever. Should the engine begin to rotate backwards, the auxiliary contact points will not separate until after the main contact points have separated. Since the auxiliary contact points are connected in series with a resistance, the current after the main contacts are broken is so weakened that no spark will result and the engine therefore cannot function in a reverse direction.

It is, of course, necessary in this arrangement that the two pairs of main contact points operate simultaneously in order to get synchronized sparks. To provide for synchronizing adjustment, the condenser-breaker plate, upon which the contact arms are pivoted, is arranged to swivel slightly, permitting as an adjustment feature one arm to advance before the other in their relation to the cam. This adjustment is secured by means of a clamping nut on the left side of the plate as shown in the illustration of the breaker mechanism. In adjusting the main contacts for simultaneous action, it is necessary that they are on the lobes of the cam at the same instant, and that the gaps between the contact points should be approximately the same. These contact points should be set so they separate not less than 0.010 in. nor more than 0.015 in. The average opening is 0.012 in.

An ingenious maintenance arrangement has been worked out to check the accuracy of synchronism by means of two 8-10 volt electric lamps, each in series with one of the main contact arms. The cam should be turned one complete revolution and the lamp should indicate the best average of synchronism. The firing order is illustrated in the diagram herewith, the cylin-

Sectional view of ignition unit

ders on the distributor end being referred to as 1L and 1R respectively, and those at the propeller end as 6L and 6R.

The firing order is as follows:

1 2 3 4 5 6 7 8 9 10 11 12  
1L 6R 5L 2R 3L 4R 6L 1R 2L 5R 4L 3R

To take care of airplane requirements, a special light-weight battery was developed for the Liberty engine. These batteries are supplied by the Willard and Exide companies. They contain but very little elec-

Arrangement of the three arms of the circuit breaker. The main breaker points are diametrically opposite and open simultaneously. The auxiliary breaker has a slight lead in normal running

Diagram of firing order

trollyte and may be turned upside down without harm. The battery is a four-cell type. The two types of battery vary slightly in detail, but in general principle they are quite similar. The battery is built within a double compartment, with the cells held in the lower part. The upper part of the receptacle forms an expansion chamber and at the same time helps to seal the battery. By means of this chamber the battery can be operated at various angles and positions without spilling the acid.

Not the least of the problems connected with the development of the Liberty aviation engine was the design

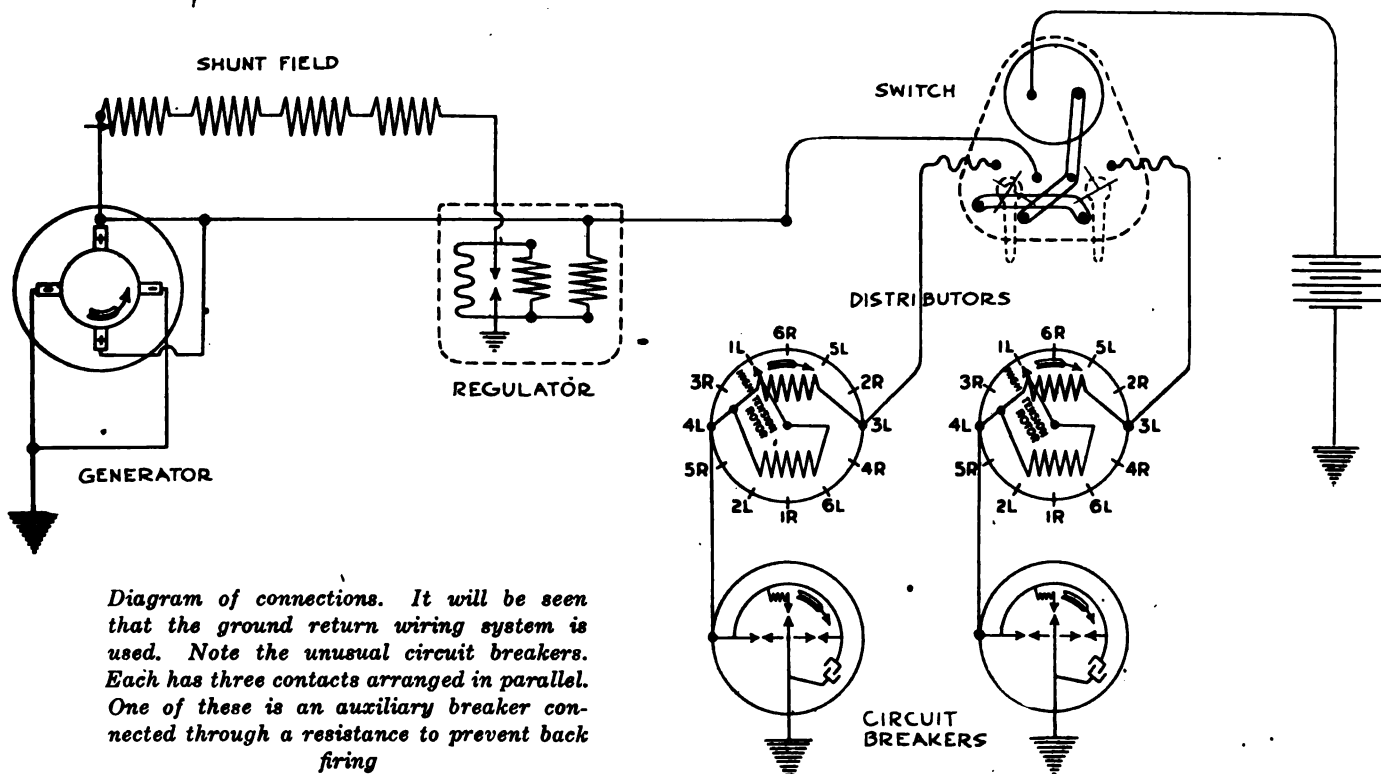

Diagram of connections. It will be seen that the ground return wiring system is used. Note the unusual circuit breakers. Each has three contacts arranged in parallel. One of these is an auxiliary breaker connected through a resistance to prevent back firing

To prevent spilling of the electrolyte in upside down flying the battery on the Liberty engine is provided with an upper closed chamber connected to the battery proper through a stand pipe. One of the sectional views shows the bent nozzle type of hydrometer used to take readings. The battery weighs 10 lb. 3 oz.

of a special type of storage battery for the ignition. This battery had to be as light as possible and made so that the acid could not be spilt during the various maneuvers of the airplane. The photograph herewith shows the Willard battery that was developed for this purpose. It weighs only 10 lb. 3 oz.

The batteries were supplied by the Willard Storage Co. and the Electric Storage Battery Co. of Philadelphia and are assembled in a single unit container made of hard rubber. No individual jars are used in the manufacture of the battery. The plates are about 3 in. sq. and 3/32 in. in thickness. Threaded rubber insulation is used between the plates, the ends of these insulators having thick ribs of hard rubber extending beyond the edges of the plates.

Referring to the cross section through a cell of the battery, a thin, hard rubber baffle plate separates the part of the cell containing the plates from the large compartment into which the electrolyte is free to flow through small holes in the baffle when the battery is in an inverted position. This compartment is of sufficient size to hold all the acid without any leakage out of the vent

hole, either when the battery is laid on its side or when it is in an inverted position. A deep, hard rubber cover and a specially designed vent plug complete the cell. Long, cylindrical posts of lead, burned to a lead insert in the top cover, serve to connect the plates with the top connectors and terminals of the battery.

The specific gravity of the electrolyte of this type of battery is read by tipping the battery on its side and taking the gravity by means of a hydrometer provided with a bent hard rubber tube, as shown in one of the illustrations. In flushing this battery each cell is filled with distilled water to a depth of 1 in. above the baffle plate. After several minutes the surplus water above the plate is removed with a hydrometer syringe. Charging is effected at a rate of one ampere. A discharge rate of 3 amp. can be maintained for 3 hr. at normal temperatures.

One of the features of this battery is the possibility of preparing it for overseas shipment in a "bone dry" condition. A battery prepared in this manner has never had any acid in the cells and can be kept in this condition for an indefinite period. When it is wanted for service the battery is filled with acid of a certain gravity and charged at a low rate until the specific gravity of the electrolyte and the battery voltage remain constant.

## New Hall-Scott Engine

**B**LOCK tests recently made showed that the new six-cylinder Hall-Scott L-6 aircraft engine is capable of developing 212.6 hp. at 1666 r.p.m. A comparison of the results with those obtained from earlier Hall-Scott models, the A-5a and the A-5, shows a considerable improvement. The output figures above given are the average for a six-hour non-stop run which was conducted under the supervision of George R. Ross, a Government inspector. The cylinder dimensions are 5 x 7 in.

One of the chief improvements in this new engine as compared with earlier models is that now all of the oil is retained within the engine, with the result that the oil consumption is only 0.01 lb. per b.-hp.-h. as compared with 0.35 lb. per b.-hp.-h. in the former models. The new engine weighs only 502 lb. as compared with 595 lb. for the type A-5a, which developed less horsepower. Most of the reduction in weight was made possible by the use of steel cylinders, which are similar to those of the Liberty engine, where cast-iron cylinders were formerly used. The greater strength of the steel cylinders permitted the use of higher compression. The test showed the fuel consumption to be at the rate of 0.55 lb. per brake hp. hr.

# Organization of the French Army Automobile Service

Equipment Included 90,000 Trucks and 150,000 Men — Subsidy Plan Made Vehicles Quickly Available—How Repairs Were Handled

By W. F. Bradley

OFFICIAL figures released by the French Government show that the automobile service of the French army comprised 150,000 men and 2500 officers, with 90,000 trucks and cars when the war ended. The value of the automobiles, together with the stocks of spare parts, is estimated at \$800,000,000. The budget for the maintenance only of this material is \$40,000,000 per month, while if the purchase of new vehicles is included the total expenditure is \$600,000,000 per month.

The French have always maintained a bigger army automobile service than that of any of the Allies or of the enemy powers. This was both a matter of policy and of necessity. Whereas the German army specialized more on railroads, the French authorities believed that the best results could be obtained from motor trucks. The great length of line held by the French army compared with the length of the other Allies necessitated the big number of trucks. Also the fact that for a long time the French were on the outside of the circle, with few convenient railroads for moving troops and supplies, had its influence on the number of trucks required.

On the outbreak of war the French army did not possess more than 7000 subsidized trucks. These were vehicles of an approved type in the hands of private owners, but which could be and were claimed by the army at a moment's notice. In addition to these trucks there were between 70,000 and 80,000 privately owned touring cars of a suitable size and power for military service, which the army also had the right to requisition.

## Sound System of Organization

A very sound system of military automobile organization had been drawn up before the war, and by means of subsidies manufacturers had been directed toward the production of a type of truck very suitable for service in the field. But although the system was good the quantity of vehicles available was altogether insufficient.

It was under this military subsidy system that the French army took over at a moment's notice the whole of the 900 motor buses in service in the streets of Paris. Some of these buses carried the 75th Infantry Regiment

into Belgium, allowing these troops to keep pace with the cavalry. Other buses had their seats ripped out and were transformed in a few hours into meat trucks. By reason of these advance arrangements the French army was able to have deliveries of fresh meat by automobile from the very beginning of the war, this work being done in a very efficient manner.

The system adopted before the war, and which has been in operation until the present date with practically no changes, was to form sections of 20 trucks, with 2 drivers to each truck, simple repair facilities, and a rolling kitchen. Such a section was in charge of a lieutenant, who had the use of either a motorcycle or a light car. Three such sections were united from an administrative standpoint (although not always working together) into a group, and the groups were united into a groupment, each with a carrying capacity of 6 battalions or 1 brigade or 1000 to 12,000 tons of material.

These automobile groups got into actual work on Aug. 10, 1914, and by the end of the month had carried 14,000 men and transported 18,000 tons of supplies.

It was immediately after the Battle of the Marne, when Gallieni requisitioned all the taxicabs and many of the private automobiles of Paris to carry a

fresh division to Meaux, that the automobile service began to extend. As an example of the increase, the tonnage transported by automobile during the Verdun battle and also during the first Somme battle averaged 766,000 a month. In June, 1918, when the Germans were making their last supreme effort to crush the Allied armies and gain possession of Paris the automobile tonnage for the month attained the record figure of 1,100,000. It has to be remembered also that the distance covered in June, 1918, was very much greater than during the Verdun battle.

## Duties of the Service

Summarized, the duty of the automobile service is to keep the army adequately supplied with men, with food, with munitions and materials, to fill the gaps in the railroad system and permit of the greatest flexibility of movement of the army and its material.

The French system is to have one automobile service for the entire army, and to adopt non-specialization of

*The French have always maintained a bigger army automobile service than that of any of the Allies or of the enemy powers.*

*On the outbreak of the war the French did not possess more than 7000 subsidized trucks.*

*It was under the military subsidy system that the French took over at a moment's notice the whole of the 900 buses in service in the streets of Paris.*

*Army sections included 20 trucks with two drivers for each, simple repair facilities and a rolling kitchen.*

*The tonnage transported by automobile during the Verdun battle and during the first Somme battle averaged 766,000 a month.*

vehicles as far as possible. The exceptions are for the Air Service and the Artillery. The automobile service of the army purchases and delivers automobile chassis to the Air Service, but is not responsible from that point on.

The Air Service purchases or builds its own bodies and maintains and operates its own vehicles. It also purchases or builds its own trailers and special vehicles. A somewhat similar state of affairs exists with regard to the artillery; the automobile service has to supply the artillery with shells, food, etc., in just the same way as it supplies the infantry, the engineers and other corps, but it has no control over the tractors and trucks used permanently by the artillery service.

#### Operated Under Difficulties

The difficulties of the work of the automobile service increased with the length of the war. In 1915 an attack was always preceded by a bombardment of several days. Thus the automobile service was warned that a call was about to be made on it, and all arrangements could be made to so organize the convoys that they could carry supplies and reserve troops to the point where they would be needed.

This was a weakness quickly noticed by the attacking party, and in 1918 long bombardments were no longer indulged in by the German armies. In the big attack on the Aisne, in the spring of 1918, the German bombardment lasted only three hours, and when the Kaiser's troops made their huge Paris drive in July, 1918, the bombardment which preceded the great infantry attack began at midnight and ended at 4.30 o'clock in the morning.

Under such conditions there was no time to concentrate automobile trucks or to bring up reserve supplies by road in time to stem the first fierce rush. This also meant that the automobile men who were in the attacked zone were put to as severe a strain as any of the combatant troops. They had to work until they dropped from sheer exhaustion; whatever food they got was snatched while driving or while waiting for instructions, and all of their work had to be done over a zone which it was in the interests of the enemy to maintain under the most intense artillery fire.

It was not an uncommon thing, under such circumstances, for men to fall asleep at the wheel and to be awakened by the loaded truck running off the road. Cases are not unknown where a tired driver, bringing back war-worn men, has run off the road in the dark, allowing his truck to fall six feet, and both the men in the truck and the driver have continued to sleep until morning.

#### Considerable Economy Effected

Non-specialization of vehicles and the rigid rule that no officer or unit shall claim a car as his or its property have resulted in a considerable economy in automobiles. A French infantry division, for instance, is entitled to six touring cars and one or two light cars for headquarters use, according to whether the division is composed of three or four regiments.

No unit in the division can claim priority in the use of these cars: they are to be used for the general work of the division. By means of this grouping the six cars are sufficient, and are kept constantly in service, covering from 650 to 700 miles a month. Without this system three times the number of cars would be necessary, and the average car mileage would not exceed 250 per month.

Although France possesses a wonderfully fine automobile service it is not above criticism, and its most

merciless critics are the French themselves. The three points which appear to be the weakest are the lack of continuity in general control; the lack of technical knowledge on the part of the higher officials, and, in consequence of this, the faulty system of allowing important repairshops to be established too near the lines.

#### Authority Changed Five Times

The controlling authority of the French automobile service has been changed five times during the war, the fifth system of management being practically the same as the first. At the present time the automobile service is a sub-division of the artillery, the head of the service being an artillery officer, Lieutenant-Colonel Pujo.

There are four different controlling forces in the French automobile service: (1) A sub-director for the artillery personnel; (2) a director for the material supplied by the Ministry of Armament; (3) a director for improvements attached to the Ministry of Armaments; (4) a director at General Headquarters for the automobile service at the front.

These four directors are responsible to three different chiefs: (1) The Minister of War; (2) the Minister of Armaments, and (3) General Headquarters. The Minister of War is responsible for the personnel, the Minister of Armaments for the material, and G. H. Q. for operations at the front.

The reformists claim that as the automobile service of the army is only a huge transportation organization, it should be established on commercial lines, with a single director at the front, where the vehicles are used, and a single director at the rear whose functions would be to supply, maintain and improve material, to recruit and train personnel. This director should be responsible to the Minister of War only, and should not be attached to any particular branch of the army. There is no more reason for him to be attached to the artillery than to the infantry, the cavalry, the engineers, or any other corps.

#### The Plan of Organization

As in the case of the railroads, the General in Chief has charge of all the automobiles operating in the zone of advance. General Headquarters has always maintained that repair parks must be kept in the zone of advance in order to assure proper repair of vehicles in service. Experience has shown that repair work in the zone of advance should be reduced to a minimum and should be nothing more than is essential to keep the vehicles in running order. From simple repairshops there have grown up in the zone of advance very complete overhaul shops employing 600 men, capable of doing elaborate work, and only removable at the cost of considerable time and money.

This system of allowing overhaul shops to be established near the lines has cost the French dear on more than one occasion. This year, when the Germans were making their drive on Paris, they captured one of these repair parks at Noyon practically intact. The officer in command of the organization, feeling nervous at the rapid advance of the enemy, proceeded to G. H. Q. to ask permission to remove. In the meantime the German army advanced. Before the officer had returned with his instructions, and while the German forces were only 2000 yards away, the entire personnel decided that the only thing left to do was to bolt, which they did, leaving the entire repair park, valued at \$1,600,000, to be captured by the enemy.

During this German drive there was a similar case at Vierzy. On the approach of the enemy it was impossible to remove the whole park, and material to the

value of \$500,000 had to be abandoned. When the Germans began their offensive of March 21 the automobile repair park at La Motte Breuil was considered to be in danger and was ordered to be removed. It went back a few miles to La Ferté sous Jouarre, and had only just begun to get into working order again when the German offensive of May 21 was launched and a further removal had to be made to Montereau. During these removals a complete month was lost.

If the zone of advance had been limited to simple, mobile repairshops, with the overhaul shops entirely in the zone of the rear, better service would have been obtained, and losses which are declared to run as high as \$3,000,000 would have been avoided.

Some critics maintain that in addition to this direct loss there was an additional loss of \$6,000,000, representing 1000 trucks at \$6,000 each, these having to be purchased to replace losses to the enemy or to meet the shortage by reason of the impossibility of carrying out repairs.

This expenditure of \$9,000,000 would have been avoided by the adoption of the general rule that all automobile overhauling should be carried out in permanent shops in the zone of the rear. It is stated that the overhaul shops at the front employ 1000 men per day to repair 3.4 trucks per day. At the permanent shops at Orleans 150 men overhaul 11 trucks per day.

Before the end of the war it was fully recognized that the overhaul work, equipped to carry out any kind of mechanical work, also to repair and build bodies, should not be under the control of the G. H. Q. and established in the zone of advance, but should be placed in the interior zone and operated on commercial lines. It was owing to the difficulty of making this change while the war was in progress that these overhaul parks were allowed to remain under the control of G. H. Q.

Very severe criticism has been leveled in France against the system which allowed non-technical men to occupy important positions in the automobile service. This defect is not limited to France, for in all the Allied armies there appears to have been a general idea that

any officer, no matter what his previous training, was capable of serving in the automobile service.

The system of judging results by numbers only, inaugurated by non-technical chiefs, has tended to develop abuses. In some parks it was the rule that only the work for which a car was brought in should be carried out.

Thus if an automobile was brought in with a broken spring, the workman would repair the springs; but if he noticed that the steering gear was also defective he would pay no attention to this.

A few days later the car would be brought back to have its steering gear attended to, and the shop would receive credit for two automobiles repaired instead of one.

As an extreme case it is stated that on one occasion an officer drove into a repair park in order to pay a visit to the commanding officer. On leaving an obliging mechanic cranked the motor, and then reported this as one car having gone through the shops for repairs.

#### Repairs at Front Not Satisfactory

The installation of the repair parks at the front has not always been satisfactory. If the officer had had technical training he did good work; if his only idea was to respect military regulations the result was bad. An officer instructed to establish a repair park in a certain locality reported that no suitable building existed there. He was told that he had received his orders and had no right to search elsewhere.

A chief of a repairshop wishing to secure better protection during the winter proposed to build woodsheds covered with tarred paper, the cost of which was 40 cents a yard. The reply of his chief was that the cost was much too high and that in consequence he should use corrugated iron. The officer pointed out that corrugated iron cost much more than wood. "No it does not," replied the chief; "the engineers supply us with corrugated iron, but we have to buy wood."

There was not sufficient technical control over the officers in charge of repair parks.

*Assembly building at the Renault plant where small "tanks" were built at the rate of 650 per month for the French and American armies. Seventy are seen in course of assembly. In the same building caterpillar gun platforms and 6-in. cannon were also assembled. This plant employed 26,000 men and is completely equipped with American machine tools*

# Artillery Tractor Production Well Started When the War Ended

3527 Completed to Nov. 1 and 1174 Shipped to France—Program  
Included All Sizes from 2-Ton Ford to 35-Ton  
Mark VIII Machines

WASHINGTON, Dec. 20—At the time the armistice was signed the War Department was preparing to place under General Pershing the finest motorized artillery equipment that has ever been devised.

Tractors and tanks were being shipped abroad in quantities and were entering quantity production in the American factories. A complete program arranged by the Ordnance Department had been designed and put into action.

It included tractors ranging from 2½ to 20 tons, and tanks of various sizes from the 2-Ford to the Mark VIII.

The work of designing and getting these tanks and tractors into operation is chiefly that of two automobile men—Lieut. Col. H. W. Alden, who designed the tanks, and Lieut. Col. W. G. Wall, in charge of tractors and gun mount designs.

The program included the 2½-ton tractor equipped with a Cadillac 8-cylinder engine, capable of hauling the French 75 mm. at 18 m. p. h., the 5-ton tractor equipped with a modified Liberty truck engine capable of hauling a 4.7 howitzer at better than 7 m. p. h., and the 10-ton tractor with a special engine designed by the Ordnance Department, and the 20-ton tractor which is a machine produced by the Holt company of Peoria, Ill.

## Mark VIII the Largest Type

The tank program included a 2-man tank equipped with 2 Ford engines, a 6-ton tank fashioned after the French Renault and equipped with a Buda engine, and the Mark VIII tank, capable of carrying twelve men, four machine guns and two 6-pounders weighing 35 tons and equipped with a Liberty engine. In addition a cargo carrier was designed with a truck body and crawl treads.

Production on November 11 of these tractors and tanks had reached a point where the 2½-ton machines were just coming through, and 1858 of the 5-ton, 1541 of the 10-ton and 128 of the 20-ton types had been produced. Of these, 450 5-ton, 643 10-ton and 81 20-ton types had been delivered in France.

The production on the Ford tanks would have totalled 1250 for the month of December and the Ford plants would have had a production of 2500 a month for January 1.

The 20-ton tank, one of the engineering marvels of the war, was exhibited yesterday at the Aberdine Proving Grounds. Assistant Secretary of War Benedict Crowell drove it over bushes and trees up to 17 in. in diameter and across the stumps.

This particular tank exhibited carried an 8-in. howitzer gun. It weighed 55,000 lb. It had made a journey overland from Peoria to Detroit and from Detroit to the Aberdine Proving Grounds at Maryland, and included among its feats the climb of a 45-degree grade and traveling through 4 ft. of water.

In its journeys overland, whenever a bridge was reached which was considered dangerous, the tank was forded across the river at some shallow point.

A demonstration was made which included the firing of a gun with the engine running. The shooting did not disturb the engine, in fact did not even cause a miss, and as quickly as the shell was discharged the tractor was gotten under way.

## 2½-Ton Machine Wins Race

The cargo carrier with a truck body and a tractor tread was designed for hauling heavy tonnage. It has all the qualities of the other tractors and is able to climb grades, but of course has not the ability to push down trees. The Mark VIII tank, which is equipped with a wireless outfit, was produced by the Ordnance Department on a joint production schedule with England, parts being made here and shipped abroad for assembly.

The 2½-ton, 5-ton and 10-ton tractors were manufactured at various automobile plants. A race between these tractors and including the Ford tank, resulted in a victory for the 2½-ton machine, which easily outdistanced the others at its speed of 18 m. p. h., but the 5-ton job, which includes the modified Liberty truck engine and which has been described before in these columns, was said by the officials to undoubtedly be the best artillery tractor that has been produced.

The Ford job is more or less freakish, but nevertheless very effective. The entire tank is less than 6 ft. high and about 10 ft. long. Entrance is made by lifting up the front metal shield through which the gun muzzle appears. The space for the two men is so small that it is necessary to back into it, and when the driver and gunner are seated they are huddled in so compactly that there is not even room to sway with the turning and jarring of the tank.

The gunner has his only view by peering through the muzzle of the gun. The driver sees only through the slits in the tower of the machine, and between severe jolts received over the ground and the spasmodic jerks resulting with every turn of the tank, the occupants have a difficult time. The tank operates at 15 m. p. h. and when turning, instead of describing an arc makes an abrupt right about or left about, which makes riding in the tank very difficult and uncomfortable.

A FRENCH report on new anti-friction metals includes trials of alloys consisting chiefly of aluminum, cadmium, magnesium and especially of zinc. Such alloys were designed to reduce as far as possible the use of copper, tin, lead and antimony, and the most satisfactory results are stated to have been given by a compound of 63.3 per cent of zinc, 21.3 per cent of tin, 12 per cent of lead, and 3.3 per cent of copper.

# Some of America's Land Battleships

*Type of gasoline-propelled railroad engine which has been developed for use in and around cantonments*

*The Mark VIII Tank, produced by the Ordnance Department on a joint production schedule with England, carries twelve men, four machine guns and two six-pounders. A twelve-cylinder Liberty engine, the same as used in airplanes, furnishes the power for this 35-ton dreadnought. A wireless outfit by which communication is always had with headquarters is a part of its equipment*

*Crawler type of heavy howitzer conveyor which is capable of going practically anywhere, even through heavy brush and forest*

*Another use of the crawler type of transmission, this time on a stake-body vehicle for carrying ammunition and supplies*

*Machine gun cavalry is the name that should properly have been assigned for these American "Baby" or 3-ton tanks, developed by the Engineering Division of the Ordnance Department. Capable of a speed double that of a horse and with one man firing at a rate in excess of the firing of ten men with rifles, this type of tank saves the work and lives of many thousand soldiers. It advances against machine gun fire, and can pull guns as well as carry fighters*

# Screw Thread International Standards

## Commission Appointed by Congress Beginning Active Work—Results of Questionnaire on U. S. Standard, S. A. E. Standard and A. S. M. E. Machine Screw Standard Threads

ON Sept. 21 last Secretary of Commerce Redfield appointed a Commission for the Standardization of Screw Threads in accordance with an act of Congress known as House Bill No. 10852. This committee was later divided into four branches, to deal respectively with (1) pitches, systems, forms of thread; (2) tolerances, classification; (3) nomenclature and terminology; (4) gages and methods of test.

The bill referred to prescribes the duties of the Commission, which, it says, shall ascertain and establish standards for screw threads, which shall be submitted to the Secretary of War, the Secretary of the Navy and the Secretary of Commerce for their approval. These standards, when approved, shall be adopted and used in the manufacturing plants under the control of the War and Navy departments and so far as practicable in all specifications for screw threads in proposals for manufactured articles, parts or materials to be used under the direction of these departments. It is also intended by the bill that the Secretary of Commerce shall promulgate such standards for use by the public and publish the same as a public document.

The first hearing for the purpose of obtaining data and views from manufacturers and users of screw-thread products was held on Oct. 7 in the Engineering Societies Building, New York City, at which the following topics were discussed:

1. As a national standard, is there any objection to the continuation of the U. S. Standard system of thread diameters and pitches for general use in practically its present shape?

2. As a national standard, is there any objection to the adoption of the S. A. E. system of diameters and pitches of fine threads?

3. As a national standard, to what extent could the A. S. M. E. system of standard machine screws be adopted?

4. There seems to be a general feeling that in standardization we should make it possible to cover several classes of work, and there has been suggested a minimum of four classes of fits to provide for different grades of work ranging from reasonably wrench-tight fits to very loose fits. Would such a classification, including at least four classes, be sufficient for all grades of work encountered in the various systems of threads previously mentioned or would a classification including more than four classes be required?

5. Is there any objection to adopting the "standard hole" practice for screw threads—that is, the practice of making all the taps for any particular thread of one basic size and securing the required fit by changing the diameter of the screw on male threaded work which is to assemble with the nut cut by the basic tap?

The consensus of opinion of those present was as follows:

1. The U. S. system should be continued practically in its present form for the ordinary threaded work, to which it is well adapted.

Objections were raised to its use for diameters less than  $\frac{1}{8}$  in. on the ground that for small work the U. S. pitches are too coarse and the threaded work too much weakened by excessive depth of thread.

2. The S. A. E. system is satisfactory for use where finer threads are necessary, as, for example, in automobile and aeroplane work.

3. The A. S. M. E. machine-screw system should be used to supplement the U. S. system for diameters less than  $\frac{1}{8}$  in., and all sizes from 14 to 30 should be discontinued in order that there may be no overlapping of the two systems. A minority thought that all A. S. M. E. sizes should be retained.

4. Classification of Fits. The general opinion was that four classes of fits would be ample to provide for all ordinary threaded work, and that very probably three classes would be sufficient, since it was felt that wrench fits, stud fits, etc., which could not be covered by general specifications should be classed as "special" and no attempt made to include them in the regular classification.

5. Standard Hole Practice. There was a sharp difference of opinion on the question of whether the nut or the screw should be made basic, with the majority favoring the former.

A part of the objection to making the hole basic arose from a misapprehension. It was suggested that if the tap or the tapped hole were made basic it would be necessary to carry in stock several sizes of bolts in order to provide for different classes of fits. Such, however, is not the case, since in general only a single class of fit will apply to each threaded product, and only that class would be carried in stock. For example, machine screws should be made within certain tolerances, while bolts for agricultural machinery would require larger tolerances, and there would be no necessity for providing for machine-screw fits on agricultural-machinery bolts, or for "agricultural fits" on machine screws.

## Carbon Tool Steels

A NEW line of carbon tool steels is being manufactured by the Carnegie Steel Co. in its electric furnace at the Duquesne Steel Works, in five grades. These five grades contain different proportions of carbon, are suitable for different uses and in manufacture and shipment are designated by appropriate labels of different colors.

Although alloy steels have been generally used for cutting tools of late, the Carnegie Steel Co. reports that in its own machine shops and in actual work in its various plants it has found that there are many purposes where a well-made carbon tool steel can be utilized in the manufacture of tools. It has been possible by the use of carbon steels to reduce the cost of machine and other tools without material loss either in endurance or in speed of operation.

To introduce these new steels the Carnegie company has issued a new publication—Tool Steel. This is addressed to users of tool steels and only essential practical information is given, while extended theoretical discussion of heat treatment and related subjects is avoided. No use is made of the terms "critical temperature" and "critical range," but instead the shop terms "line of hardening" and "minimum grain size" are used.

In standard works of reference on metallography and heat treatment may be found figures illustrating the changes which take place in various kinds of steel under heat treatment. These, however, are, as a rule, steels of different carbon content, alloy steels, etc., so that a direct comparison is not possible. In Tool Steels are given illustrations of Metcalf test pieces and full-size test piece fractures made from specimens treated and tested at the Carnegie shops.

There is also a chart of heat colors, with its corresponding heat treating temperatures, based on carbon steels. Names of colors have been selected to conform to most general uses and are checked by indication of temperature in degrees Centigrade and Fahrenheit.

A chart of temper colors is likewise entirely new as regards the form in which it is presented. It is a direct reproduction by color photography from test pieces heat treated to the temperature shown.

# The Allen Self-Locking Differential

**A Simple Device Embodying the Reversible Ratchet Principle—Drive on Curves Is Entirely Through Inner Wheel—Loss of Traction of One Wheel Cannot Stall Car**

A DIFFERENTIAL of the type which drives on the inner wheel only when the vehicle is turning a corner, and which gives positive traction on one wheel, irrespective of the condition of the ground on which the other wheel may be standing, is manufactured by the East Iron & Machine Co., Lima, Ohio, and is to be marketed under the name of the Allen differential.

It comprises a pawl and internal ratchet mechanism, the ratchet device being automatically controlled. Each of the two ratchet wheels is provided with a splined hub which is fitted to one of the axle shafts, and in addition to the wheels there is a spider ring carrying the driving pawls. The pawls are set in the spider ring with limited movement, and the whole is secured to the casing to which the main gear wheel is either bolted or riveted. The driving mechanism, consisting of the ratchet wheels, spider and pawls, is assembled and secured in the casing. The spider ring arms are secured in slots in the casing with a limited movement, 3/16-in., which movement automatically changes the pawls from the position of forward to that of reverse drive. Hence, the backlash of the differential is only 3/16 in., and in operation the device is said to be absolutely noiseless and without shocks.

When the mechanism is pulling both wheels, in driving straight ahead, all parts move together as a unit. When one part moves faster, as in rounding corners, there is no load on that member. In rounding corners, the outer wheel overruns the driving pawl, making it a free wheel. The inner wheel then takes care of the entire load. Should the driving wheel encounter slippery surface and lose its traction, the outer wheel will pick up the load until such time as the inner wheel again secures sufficient traction.

When the driving clutch is disengaged, and the engine thereby disconnected from the driving mechanism, the differential automatically reverses and its reverse pawls control the wheels on the momentum drive. A light application of

*Longitudinal and cross section through differential*

the brakes will then stop the car. When the power is again applied, the differential automatically changes to the position for forward drive. The chief advantage claimed for the Allen differential is that it makes a vehicle practically un-stallable.

We understand that this differential has been given extensive tests, both on passenger cars and on 3½-ton trucks.

THE predominant contributor to the world's supply of petroleum is the United States, which furnished no less than 64.74 per cent of the estimated total for 1917, the others in order of importance being: Russia, with 13.26 per cent; Mexico, with 11.37 per cent; the Dutch East Indies, with 2.74 per cent; Rumania, with 2.08 per cent; India (Burma and Assam), with 1.61 per cent; Persia, with 1.32 per cent; Galicia, with 0.947 per cent; Japan, with 0.615 per cent; Peru, with 0.511 per cent; Trinidad, with 0.303 per cent; Germany, with 0.189 per cent; the Argentine, with 0.170 per cent; Egypt, with 0.094 per cent; Canada, with 0.037 per cent; Italy, with 0.002 per cent, and other countries, with 0.006 per cent.

# Development of the Aircraft Spruce Industry

Douglas Fir Used as Substitute in Less Exacting Work—Figures of Monthly Cut—Woodworking Plants Put to Making Finished Airplane Parts—Byproducts Disposal a Serious Problem

## PART II

By Lawrence K. Hodges

**O**WING to the relatively limited stand of spruce, to the difficulty and expense of increasing production and to the urgent necessity of rapidly expanding supply of airplane lumber, resort has been had to Douglas fir, which now constitutes about half of the cut. Spruce is reserved more particularly for combat and bombing planes, because of its combination of strength with lightness and resiliency and because a bullet cuts a clean hole instead of shattering it. These qualities enable a plane in which it is used to fly higher and carry more weight than one framed of other wood, and to remain in the air after its beams have been punctured with bullets which would have sent other planes to earth with broken wings.

Fir is strong but heavier and is more apt to shatter, but is well adapted for training and reconnaissance planes. Port Orford cedar is also used, being superior to fir, but there is only a small stand in the extreme southwestern corner of Oregon, and the entire output is shipped to the Allies.

The results accomplished in the course of the year that General Disque has been in control are told in some eloquent figures. In August, 1917, shipments totalled 202,264 ft. and in response to the pleas of the Allies an increase to 2,683,329 ft. was accomplished, all of this being spruce. In October, 1917, when cutting of fir stock began, the total was 3,443,667 ft.

Output increased steadily from month to month and showed a spurt after the Vancouver mill began cutting, until in August, 1918, the total was nearly 18,500,000 ft. and in October almost reached 20,000,000 ft., about equally divided

between spruce and fir. In fact, the shipment of good stock increased far more rapidly, for before the cut-up plant was put to work in February the totals were subject to a discount of 90 per cent for rejections, while since that time all stock shipped has been as nearly perfect as it can be made when cut and trimmed to wing-beam size.

Last November the Spruce Division aimed to reach a monthly output of 10,000,000 ft., and this mark was passed in March, but in April, in consequence of the great German offensive, it was raised to 30,000,000 ft. There is good promise that this point will soon be attained as the new mills come to full production. Growing efficiency of the men as they gain skill and experience aids powerfully in swelling output. In August the output at Vancouver was more than double that which was originally planned, and it steadily grows without addition of new units, though with improvements in machinery.

### Three Plants for Making Finished Parts

The Government has begun carrying production of airplane lumber on the Pacific Coast still farther by employing three woodworking plants to make finished parts to a tolerance of one thirty-second of an inch, ready for fitting and assembling in the airplane factory. The plants and skilled labor on the Pacific Coast are ample to furnish all the stock produced for the United States, and the depression in building has left them practically unoccupied except in finishing work for ships.

The stock turned out by the cut-up mill is further trimmed,

Interior view of airplane lumber mill erected by the Government at Vancouver, Wash. This huge building was put up in the record time of 45 working days

H. S. MITCHELL  
Designer and Manager of Government airplane lumber mill at Vancouver, Wash.

*To reach the heart of the timber the Government has built 166 miles of spur track. From these lines plank or corduroy roads branch into small canyons and over them motor trucks haul logs to railroads*

and that process reveals defects which cause rejection of 30 to 40 per cent. If this work were done on the Coast, a further reduction of 75 per cent in the tonnage shipped might be effected.

Planing mill men suggest that much material might be saved if wing-beams were built up of thin laminations rather than composed of solid pieces. A single knot or other defect may cause rejection of a beam 20 ft. long, though it may be otherwise sound. By laminations all the sound part of that beam could be used. Also a solid beam may be perfect to all outward appearances, but may have internal defects which would be discovered and eliminated if it were cut into thin laminations.

The layers of wood could be overlapped to give the same strength as is obtained in a solid stick, and added strength would be gained by elimination of defects which would otherwise be hidden. Much lumber which is now rejected would also become available for airplanes.

When it is considered that the present accessible stand of spruce in Oregon and Washington is estimated to yield at the most 700,000,000 ft. of airplane stock and that consumption will soon reach 15,000,000 ft. a month, economy dictates that the proportion made available for aircraft be greatly increased. Aviation in commerce and travel may soon be as general as it now is in war, and without such economy the best airplane lumber may reach an impossible price.

#### Problem of Side-Cut Lumber

The tremendous impetus given by the war to production of spruce for aircraft has created a serious problem for the lumbermen; that is, how to dispose of the side-cut lumber, meaning the product unsuited for aircraft which must be cut in process of cutting airplane stock. At the Government mills this amounts to 44 per cent of the output, but in commercial mills it is 80 per cent. The sudden increase in production of this class of lumber is indicated by the fact that there are now 52 spruce mills and that 25 of these cut spruce exclusively, as against a total of 25 four years ago which cut one-fourth spruce to three-fourths fir and cedar.

Formerly a market was found for the smaller output in building, boxes and food containers. With an output several times as large, the demand for building is at its lowest ebb, and a tremendous expansion of the market for other uses will be necessary to absorb the growing stock.

Side-cut in immense quantities is piling up at the mills, and it constitutes a financial burden to the manufacturers

and to the Spruce Division, as well as an obstruction to their operations.

To cope with this problem, General Disque has established a sales department and has placed in charge Lieutenant Thor W. Sanborn of Kansas City, who has been selling West Coast lumber for sixteen years and has made spruce his specialty.

He has divided all the country east of the Missouri River into districts, each of which is in charge of a trained salesman and is supplied with a stock at its commercial center, from which prompt delivery can be made.

A planing mill has been added to the Vancouver plant to finish side-cut. A Spruce Bureau has also been established by the West Coast Lumbermen's Association with Ralph C.

Angell as manager, and he works in co-operation with Lieutenant Sanborn. They are urging the Government to use spruce in some of the vast number of packing cases which it uses for supplies, and the suggestion has been made that boxes and crates for airplanes alone would consume 300,000,000 ft. a year as long as the war lasted.

#### Raybestos Molded Disc Clutch Facing

THE Raybestos Co., Bridgeport, Conn., has recently announced a new type of facing for disc clutches, known as the Raybestos molded disc clutch facing. It is composed of pure asbestos with a suitable binder, molded under great pressure. This process of manufacture is said to insure a homogeneity and an accuracy impossible with the woven type of facing, which was composed of asbestos spun around a composition wire (the wire to give the required tensile strength), this in turn being woven into tape, which was subsequently formed into a ring.

Discs of this molded facing can be made endless, which was impracticable with the woven facings. Owing to the homogeneity of the facing its frictional properties do not change as it wears away.

Among the claims made for the new facing are the following: It presents approximately 20 per cent more surface to the steel disc, consequently it increases the capacity of a clutch of given dimensions. It permits of a clutch easy in action, positive in release and free from sticking. The friction coefficient is given as between 0.35 and 0.40.

*Raybestos molded disc clutch facings*

# Pickling with Nitre Cake

Permits of an Appreciable Economy in Steel Cleaning and Reduces Demand for Technical Sulphuric Acid

**A**N investigation has been made by the Bureau of Mines regarding the availability of nitre cake for pickling steel. At the present time sulphuric acid is used for the purpose but the acid present in the thousands of tons of nitre cake produced in the manufacture of nitric acid for explosives might be utilized to the extent of releasing an equivalent amount of technical acid from industries which might find it economically practicable to adapt their processes to the use of a substitute. The nitre cake which is left to weather in the open, soaking into the land and polluting the streams, is a source of manufacturing nuisance, as well as an economic waste, the correction of which would partially relieve the strain on sulphur and acid production.

## Nature of Nitre Cake

Nitre cake is, popularly, a mixture of neutral sodium sulphate with a varying proportion of sulphuric acid; more properly, it is an impure acid sulphate or bisulphate of soda carrying a variable excess of sodium sulphate or, infrequently, of sulphuric acid, from kettles improperly charged or prematurely drawn. Sodium bisulphate contains, chemically, 40.6 per cent sulphuric acid combined with 59.4 per cent sodium sulphate in the double salt of the formula  $\text{NaHSO}_4$ . Nitre cake may occasionally have the same approximate composition, but its acidity usually ranges between 28 per cent and 44 per cent sulphuric acid, depending on the working conditions surrounding its production. In addition to the substances already mentioned, the cake contains small percentages of iron, aluminum and silica as regular impurities, with traces of arsenic, sodium nitrate or nitric acid as accidental impurities. The following analysis is fairly typical of its composition:

Silica .....	0.10 per cent
Oxides of Iron and Aluminum .....	.45 " "
Free Acidity, $\text{H}_2\text{SO}_4$ .....	34.55 " "
Sodium nitrate .....	.05 " "
Sodium sulphate .....	64.75 " "
Sulphates of Calcium and Magnesium	Trace

Nitre cake is, then, an indefinite chemical compound which, like sodium bisulphate, or acid sulphate, breaks up in solution into sodium sulphate and free sulphuric acid, entirely available as such for metal cleaning. Thus the pickling capacity of one pound of the nitre cake whose analysis is cited above is equivalent to 0.37 lb. 66 deg. Be. (93.2 per cent) sulphuric acid, or to 0.44 lb. 60 deg. Be. (78.04 per cent) sulphuric acid.

## Method of Use

Cleaning with nitre cake solution does not differ essentially from pickling with acid, but it introduces certain necessary manipulative changes due to the presence of sodium sulphate in large proportion as a diluent. Sodium sulphate in hot concentrated solution tends to reduce the activity of the acid; as a result, pickling with nitre cake alone of approximately 33.3 per cent acidity, requires from  $1\frac{1}{2}$  to  $2\frac{1}{4}$  times the period demanded by acid under similar conditions. The reaction velocity of the solution of nitre cake of acidity 41 per cent is at least twice as great as the solution of a cake of 32 per cent acidity at the same temperature and concentration. Hence, a mixture of three parts of nitre cake with one part of 60 deg. acid, or four parts of nitre cake with one part of 66 deg. acid should serve to maintain normal production and at the same time effect a saving of acid. In some processes it has been found practicable after a few experimental runs to substitute acid entirely with nitre cake; the time

element involved in experiment and operation, however, forbids entire substitution in most work.

In most works operating with nitre cake solution the bath is made up with nitre cake and acid sufficient to give the desired strength for pickling (2-10 per cent free  $\text{H}_2\text{SO}_4$ , reckoning the acidity as  $\text{H}_2\text{SO}_4$  vs. water, rather than  $\text{H}_2\text{SO}_4$  vs. weight of solution); successive additions of nitre cake and acid are made during the day as deterioration of strength demands until the density of the hot solution approaches specific gravity 1.26-1.28. "Killing down" is then begun; the temperature of the solution is raised to 200-205 deg. Fahr. and maintained until analysis shows an acidity of 0.002-0.004 gm.  $\text{H}_2\text{SO}_4$  per c.c.

Occasionally it is found practicable, through normal interruptions of operation, to let settle the particles of scale and other extraneous matter suspended in the bath, to draw off five or six inches of "sludge" from the bottom of the tank and replace with an equal volume of water and nitre cake.

## Supplementary Tank System

By the installation of a supplementary system for continuous operation in conjunction with the pickling the settling may be even more comprehensively effected. Such a system involves the use of two extra tanks separate from the actual pickling vats. The initial cost of installation is moderate, the cost of maintenance small.

The first of the supplementary tanks serves partly as a pass tank, into which the partially spent pickle solution may be dropped by gravity prior to being raised by steam-injector, air-lift, or compressed air to the main settling tank. The latter, in turn, is placed on a higher level than the main pickle tank, to permit again of gravity flow from the upper levels, gage-controlled, back to the working tank.

The first, or pass-tank, may, by the introduction of the necessary steam coils and proper ventilation, be used as a dissolving or fortifying tank. Here the acid or nitre cake is run in and dissolved to the necessary amount, and the solution then raised to the main settling tank, in which dirt and suspended rust and scale are deposited and at intervals drawn off at the bottom with such sulphate crystals as may separate as the liquor cools. In this way scale and crystals may be recovered, the solution cleaned, and its gravity and consequent viscosity reduced, while the acidity may be maintained at a practically constant value.

A system of this general type is by far the most economical for handling pickle liquors. Reasonable care in its operation tends to eliminate losses of small percentages of acid which are ordinarily run to the sewer; to minimize the spotting of material resulting from the red oxide deposits carried out of dirty solutions and which are often with difficulty rinsed off in the wash tanks; and to give a mobile cleaning solution at all times of uniform acidity and free from suspended undissolved salts.

The process necessitates no interruptions; it provides a continuous cycle of operations in which the dissolving of pickling agent, cooling, crystallizing and settling are permitted a sufficiently long interval in which to keep up with pickling, provided a fair reserve of solution is kept in circulation in the liquor storage. Solutions may be rejected and renewed without interfering with the cycle.

The system is applicable to both hand and machine, as well as plunger, pickling—especially to those processes of pickling heavy stock in which it is not uncommon practice to run the solution to the sewer as soon as the material is cleaned without making a determination of spent acid and regardless of

the waste which is entailed in such summary starting of the tank plugs.

With proper chemical supervision the crystallization in the settling tank may be so controlled as to yield, from the stronger solutions, a good technical grade of ferrous sulphate.

#### Modifying Agents

The pickling solution of nitre cake and acid may be still further modified by the addition of other substances in small quantities to produce specific effects. Thus, a fraction of a per cent of an organic body, such as spent tan-bark, quebracho fibre, waste sulphite liquor from the extraction of pulp-wood chips, or of one of the various non-fumes or no-gas compounds on the market, serves to blanket such acid fumes as may be carried out by the steam, and at the same time assists in removing oil or grease deposits from the metal. Again, calcium fluoride helps to slough off particles of furnace bottom which sulphuric acid only with difficulty affects. Finally, sodium chloride added to the cleaning solution accelerates attack on alloy scales, particularly those containing nickel and tungsten; while nitrate of soda is apparently without beneficial action; the presence of free nitric acid causes pitting of low carbon steels, notably in the case of metal for wire and tubes.

#### Summary and Extension

1. From ten to twenty per cent economy may be effected in steel cleaning by (a) suitable temperature regulation designed to check fume loss as well as steam and fuel waste; (b) the use of polarizers or inhibitors adequate to minimize dissolving of sound metal and to blanket entrainment of acid in vapors rising from the surface of the bath; (c) methodical chemical and mechanical control maintained to prevent live steam losses at worn fittings and acid waste in splashing, leaky equipment, and in spent solutions rejected before the acidity has dropped to a specified limit of 0.3-0.5 per cent or less.

2. Except in the cases of a few special processes, nitre cake may be substituted for 50 per cent of the acid now used for steel pickling. In those industries where time is not the controlling consideration the substitution may after trial be made even entire. The maintenance of production and the lining up of co-ordinate operations demand with present equipment, however, the use of acid to accelerate the action of the nitre cake solution; otherwise total substitution requires a 30-50 per cent increase of tank equipment.

The exceptional instances in which the adoption of nitre

cake pickling tends to introduce disproportionate hardship include (a) highly polished hard steel wire and drill rod; (b) butt-welded tubing for enameled conduit, the interior of which must be energetically pickled with a readily mobile, rapidly circulating acid solution for the removal of siliceous furnace bottom without undue reduction of the exterior wall; (c) the finer grades of tin-plate; and (d) those processes and plants in which the spent pickle liquor is concentrated for copperas recovery.

Sand-castings should be cleaned with a mixture of sulphuric and hydrofluoric acids. High nickel-chrome and tungsten-vanadium-chrome alloy rod and wire are best pickled in mixed hydrochloric-sulphuric acid, or with sulphuric acid in conjunction with common salt.

3. The chief objection to the use of nitre cake in the cleaning of tin plate and sheet stock appears to rest on a physical or mechanical problem. The cake is ordinarily added to the machine tanks in lumps, which, dissolving irregularly, lead to momentary irregularities of acid concentration and consequent burning of the sheet; or, added as a powder or ground cake at the surface of the bath, it deposits on the sheet and causes local pitting or smudging which appears on the finished material as pinholes or blisters. The preparation of clear solutions would seem to be the proper corrective of these faults.

4. The shipping and handling of nitre cake demands special cars and storage and an increase of transportation tonnage over that required for the equivalent acid. The increase of labor for handling is an essential item, though not a serious one except where extreme labor shortage obtains. Control of operation at the pickle tanks requires certain alterations of process of handling which the majority of plants are prepared to make.

5. The exploitation of nitre cake as a commercial material has been only too frequently accompanied by enthusiastic but extravagant assertion of its effectiveness as cure for all the ills incident to pickling. Unquestionably it produces in most work a better metal surface than does acid alone; it reduces the fume nuisance; effects a saving of metal and acid; and aids in the utilization of a valuable technical product whose rejection at the point of production is a vast economic waste. But it can be regarded as a total substitute for sulphuric acid only under exceptional circumstances; its action is substantially slower than commercial acid solutions, and the labor required to handle it is necessarily greater. Its use as a beneficial substitute demands intelligent experiment until the conditions governing its behavior are understood.

## New Lathe Chucks for Spur and Bevel Gears

**L**ATHE or grinding machine chucks designed to permit of chucking spur, bevel and other gears quickly and accurately are being manufactured by the Garrison Machine Works, Dayton, Ohio. The chuck for spur and internal gears and sprocket wheels is known as the Johnson chuck. It is designed for use when it is desired to remachine or regrind the holes in the gears concentric with the pitch diameter. It is claimed that use of these chucks obviates the loss of expensive parts due to questionable chucking methods, lack of judgment or carelessness on the part of the operator. With the Johnson chuck a spur gear can be chucked accurately in four to six seconds. The work is entirely automatic and does not depend upon the skill of the operator. Adjustment of the chuck for a different size of gear requires only two minutes. With one set of chuck members the Johnson chuck holds all gears of a given pitch, and it has no loose parts. The bearings of the chuck are protected against emery or grinding solution. The chuck can be applied to any grinder, the same as an ordinary chuck, and it serves also as a gage for the pitch diameter, indicating over a range of 0.030 in. the amount the pitch diameter is out either plus or minus. These chucks are of an outside diameter equal to the pitch diameter of the largest gear to be chucked plus the outside diameter of a 24-tooth gear of the same pitch.

For chucking bevel gears the same company manufactures the O. G. bevel gear chuck. With this bevel gears can be

chucked accurately concentric with the pitch diameter, and the operation for a gear of 6 in. pitch diameter requires only 5 sec.

In chucking the gear the clamps are all turned simultaneously into radial positions over the gear and clamped by turning a knob back of the chuck to the right. To unchuck the gear this knob is turned to the left, which automatically loosens all clamps, turns them out of the way of the gear and raises and holds them until another gear is inserted.

Ready to receive gear

# Hair-Line Defects in Crankshafts

## Metallographic Study and Physical Tests of Chrome Nickel Steel Crankshafts to Determine Nature and Effect of So-Called Hair-Line Defects

### PART II

By Lieut. P. J. Piccirilli

Fig. 8—Test specimens, showing fractures, impressions of gripping jaws, etc.

FOUR tension tests were also made upon small flat specimens of reduced sections, cut from shaft B. Two of these were cut from the cranks, so as to obtain test pieces at right angles to the direction of the fibrous structure of the material, to permit of determining the strength of the material across the grain, with its resultant fracture. These pieces were necessarily short, so that it was possible to obtain only the yield point and not the true elastic limit. The result of the two tests made give average values of elongation of  $14\frac{1}{2}$  per cent; reduction of area, 30.4 per cent; yield point, 109,900 lb. per sq. in., and ultimate strength, 129,050 lb. per sq. in. The fractures appeared laminated at right angles to the axis of the piece, as was expected from the nature of the material as brought out by the fractures obtained in the compression tests. Two flat test specimens were cut from one of the pins, longitudinally, so that the tensile stresses produced would coincide with the direction of the fibers. These pieces were of sufficient length to permit of using the 2-in. strain gage, so that strain readings could be taken for increasing loads. The results of this test were plotted as shown in Fig. 15. The tension tests as above described indicated that the elastic limit of the material of the shafts, both with and across the grain, was approximately 80,000 lb. per sq. in. Also that the ultimate tensile strength ranges from 120,000 to 130,000 lb. per sq. in., possessing a fair degree of ductility, the average elongation amounting to 15 per cent and the reduction of area to 38 per cent, and although the structure of the metal is different in the two directions tested there is no material difference in strength. Fig. 8 shows at A the end of the original shaft A which failed in the grips of the torsion testing machine. It clearly shows the manner in which the end of the shaft collapsed and sheared, due to the reduced sectional area. At B is shown the full sized tension specimen, illustrating the extent to which the end was compressed by the gripping action of the jaws of the testing machine, and also showing the

character of the fracture produced. C illustrates the manner in which the mirror was attached to the shaft, during the torsional experiments. The four small tension specimens are mounted as shown at D, Fig. 8.

After completing the various tests described which were to determine the effects upon the physical properties of the material, due to the existence of so-called "hair-line" defects, a series of metallographic tests were made. These tests were to supplement the physical tests in order to reconcile the results of the same and to determine the exact nature of the "hair-lines."

The chemical analysis of the shaft was as follows:

Carbon	.....0.36	to 0.48
Manganese	.....0.70"	to 0.84
Phosphorus	.....0.01"	to 0.034
Sulphur	.....0.018"	to 0.042
Chrome	.....0.85	to 1.14
Nickel	.....1.20	to 1.43

A piece of the defective bearing was cut along A-A, Fig. 9. After polishing the sample for non-metallic inclusion, it was treated with picric acid in alcohol to

Fig. 9—Showing how sections were cut, from which metallographic studies were made

Figs. 10, 11 and 12—Metallographic sections, showing dots of manganese sulphide and oxide of iron

develop the structure and careful metallographic observations were made. It was noted that the material was full of dots of manganese sulphide and oxide of iron. It was plainly seen that below the "hair-lines" there was no evidence of any flaws, the metal appearing more or less normal. This was an indication that the "hair-line" was entirely a superficial defect. The dots of manganese sulphide can be plainly discerned in Fig. 10. By referring to Fig. 10 it will also be noted that the metal appears streaky, as if segregated areas had been laminated by forging. These streaks were more definitely developed by etching. It was also noted upon etching the metal that the structure was prominently martensitic, being coarser on the inside of the section which was cut than on the side nearer the finished surface, or outside. The streaks referred to are plainly seen in Fig. 10 to run diagonally. These streaks in their particular arrangement are not considered an uncommon occurrence in chrome nickel steel forgings, and their existence is believed to be due to the segregation of the chromium.

Another sample was cut from the shaft, as indicated by the lines B-B, and upon metallographic observations of the same it was noted that the manganese sulphide and oxide of iron lines appeared drawn out into fine strands. The direction of these fine strands was parallel to the forging or length of the shaft. These parallel lines of manganese sulphide continue for some distance, then bend over, become shorter and finally appear as dots, as can be seen in Figs. 11 and 12. In other words, referring to Fig. 9, Section BB, the manganese sulphide lines appear drawn out into lines parallel to the forging or length of the shaft, along the surface O'O and cross sections at M'M of section BB. This confirms the supposition that the "hair-lines" are threads of manganese sulphide and iron oxide, drawn out by forging operations so they would naturally appear in longitudinal sections at O'O and cross sections at M'M. On etching, the struc-

ture was martensitic, as before, and decidedly streaky along O'O (Figs. 11 and 12).

In order to determine whether the streakiness referred to was due to segregation or not, a longitudinal section at 90 deg. to the section BB was taken and heated to 840 deg. C., held at this temperature for 30 minutes and slowly cooled in the furnace. Upon etching the metal was found to be strongly laminated, and the ferrite strung out parallel to the direction of the forging. Fig. 13 shows the structure at O'S, Section BB, Fig. 9. Fig. 14 shows the structure of the cross-hatched area of Section BB, with the ferrite bands broader and slightly inclined. Hence it is reasonable to assume that the streakiness is due to the segregation of chromium.

### Summary

As a result of the physical and metallographic tests carried out the following conclusions were derived:

(1) The torsion test indicates the elastic limit of the central portion of the shaft to lie between 60,000 and 70,000 inch-pounds, corresponding to a shearing stress of 49,400 pounds and 67,600 pounds per square inch.

(2) Compression tests indicated that the surface defects, three of which had been previously strained in torsion beyond the elastic limit of the material, did not develop any signs of local weakness until considerable deformation was produced.

(3) Tensile tests were made, three with the fibre and two across the fibre. These tests showed that there is no material difference in strength parallel with or across the fiber. The elastic limit of the material in tension is

# Cultivating the Chinese Automotive Field

There Is a Great Need for Cars, But the Absence of Good Roads Has Retarded Automotive Development—Majority of Cars in Use Are American—High-Priced Cars of Striking Color Have Been Popular

By Tom O. Jones\*

**C**HINA'S future as a market for motor vehicles depends absolutely on the construction of roads throughout the country. While the population of the Republic is said to be over 400,000,000, there are many millions of Chinese of the coolie class who never in their lifetime can hope to do more than make the barest kind of a living and countless numbers of the lower middle class who are far away from car ownership. Even if the buying power of the people were many times greater, the market for motor vehicles would be extremely small because of lack of highways. No matter how wealthy a resident of any district may be or how great his desire to own a motor vehicle, he will not purchase if there is no place in which the car can be used.

It may be said that China has no roads outside of those found in the foreign concessions of the treaty ports, but this statement is not strictly true, because in Peking there are nearly 150 miles of streets, including those of the legation quarter, that are suitable for motor cars, and there are short stretches of roads scattered throughout the Republic that might be used.

This report does not cover all China, but only the central and northern parts. Central China is taken to designate the Yangtze Valley, while North China the territory of which Tientsin is the chief treaty port and distributing center.

In these districts there are, at the present time, approximately 2000 motor vehicles in operation, practically all of them passenger cars and the majority of American manufacture. It is the territory destined to furnish the best market for motor cars, largely because the topog-

raphy of the country is more favorable to road building.

The principal buyers of motor vehicles in China have been the foreign residents in the treaty ports, but it is evident that the market in this field is limited, although the foreigners in China must be considered as offering better prospects for motor-car sales than the same number of citizens in an American city. The future of the motor car in China lies with the Chinese themselves, and it is this field that the wise motor dealer in that territory is now cultivating.

Generally it may be said that the Chinese are favorable to the motor car, especially the younger generation. At present their choice is a high-priced distinctive car of striking color, fitted with as many accessories as possible, but men who know China are convinced that the small and medium-priced car will be the popular car of the future.

## Customs and Habits Change Slowly

The Chinese are slow in changing customs and habits which have been followed for centuries. Until comparatively a few years ago the sedan chair and the native wheelbarrow, with its large wheel in the center, were practically the only means of passenger travel in all parts of the Republic, even among the wealthy, and they are to-day in many sections. With the advent of the European came the coolie-drawn jinrickshas, now found in hundreds of thousands all over China, and with them the use of horse-drawn carriages, two vehicles now generally used by both the Chinese and the Europeans.

Practically all the motor-car selling in China is in the hands of the Europeans or Americans in treaty ports.

*Camels, donkeys, jinrickshas, Peking carts and rambling pedestrians do not add to the pleasure of motor car driving in China*

\*EDITOR'S NOTE—Mr. Jones was formerly with the J. B. Crockett Co., New York, and was given a special appointment by the Bureau of Foreign and Domestic Commerce to investigate automotive conditions in Japan, China, the Philippines and Hawaii. This story is taken from the advance proof sheets of Mr. Jones' report to his department.

*In North China camels solve transportation problems*

*Ideal Chinese road, the center macadam and the sides dirt*

*Narrow city street in China with a good road surface but too crowded for vehicular traffic*

*One of the reasons why there is no motoring outside cities in North China. This was probably a good road in the Ming dynasty, several hundred years before the advent of the motor car*

Most companies make contracts directly with the motor-car dealers, although some are held by importing houses, either independent concerns or branches, which are given territorial rights for certain sections. For the American manufacturer the most satisfactory connection should be an American firm, a policy that we would do well to follow to a greater extent in our general export business. This is said not in disparagement of any of the European houses, but simply as an American business principle, and one that is applicable in all countries.

The established dealers in China are in position to pay cash against shipping documents, either through their own resources or by arrangement with their banks at an interest charge of about 7 per cent. It should be borne in mind that the treaty ports have been one of the best fields in China for European cars of all types, and here, as in other parts of the world, the American manufacturer may be forced to make some financial concessions to meet this European competition after the war.

When selling to Europeans, the dealer, of course, deals directly with his customer, and the same is true in many sales to Chinese buyers. But often the salesman has to work through several intermediaries and pass out "presents" to each. One representative in Peking, before sending a salesman out, usually lets him know just how much can be given as presents. He told of one case in

which this had been done, and the buyer had ordered a car, but before it could be delivered and payment received, there was one intermediary who had been overlooked and who had to be taken care of to the extent of \$70 before the deal could be consummated.

Prices of cars are rather generally known through their advertising, although there may be changes in prices between different shipments, so that it is not well for the dealer to allow his prices to vary too greatly.

#### Types of Cars for China

It is impossible to point to any one car and say that this is the type that will meet with the greatest favor in the general market in China. Open or closed body, long or short wheel base, high or low price, influence sales in about the same proportion as in America. There is a field for all types and all prices. The population of China, at least the motor-buying portion of it, is probably the most cosmopolitan in the world. In the treaty ports, the European colonies and Peking are thousands of foreigners from every country in the world. Manifestly, the buying power and choice of this foreign population is varied.

As a whole, the foreign population in China would probably show a greater buying power than any other

### HORSELESS AGE SUBSCRIBERS

Subscriptions for the Horseless Age transferred to the subscription list of AUTOMOTIVE INDUSTRIES in the merging of the two publications will be completed in full by the weekly issues of AUTOMOTIVE INDUSTRIES to the dates of expiration shown on the records of the Horseless Age Co.

Owned by United Publishers Corporation, Address 243 West 39th St., New York; H. M. Swetland, President; Charles G. Phillips, Vice-President; W. H. Taylor, Treasurer; A. C. Pearson, Secretary.

Entered as second-class matter Jan. 2, 1903, at the post-office at New York, New York, under the Act of March 3, 1879.

Member of the Audit Bureau of Circulations.

Automotive Industries-The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

## The Inventor's Opportunity

**I**N all the history of industrial development there probably have never been such opportunities to get manufacturing concerns to take up new articles as there are at the present time.

Thousands of manufacturing plants have been engaged on war work, and a great majority of these suddenly had their contracts canceled while working on them to full capacity. Of course, many of these previous to the war were engaged in well established lines of manufacture to which they will return. Others, however, were specially organized for munitions or other lines of work directly connected with the war; their products have been of a nature for which there is little or no call in peace times, and they are confronted with the difficult task of quickly shifting to other lines for which there is an established peace-time market unless they want to see their organizations disintegrate.

Under ordinary conditions the inventor or industrial pioneer has a most difficult time getting manufacturers interested in his inventions. Conservatism

is a common quality of human nature, and as long as there is a fair demand for his product a manufacturer is apt to be disinclined to make radical improvements or take on entirely new lines. Under such conditions it is the task of the inventor to overcome the obstacle of conservatism, and that often proves beyond his powers.

At the present time, in the case of concerns which have been suddenly left without a line of marketable products, there is absolutely no such obstacle to overcome. The inventor of a practical device for which a ready sale can be found not only has no difficulty in getting a hearing but is actually being sought after.

The average inventor does not make a good manufacturer. He is too much wrapped up with the glamour of invention—too much bent on improving things—to be content to settle down and produce a standardized article. Of course, if we go back three or four decades it is not difficult to mention a considerable number of inventors who became successful manufacturers; but, in the first place, there are exceptions to every rule, and, secondly, manufacturing in those days was not conducted on the same lines as it is now.

To-day, with numerous firms having excellent manufacturing equipment and splendid organizations looking for new products to take up, the inventor who has an article of merit certainly stands an unprecedented chance of reaping his due reward.

## Cast Connecting Rods

**A**LTHOUGH every engineer familiar with high speed combustion engines knows that, owing to the inertia of the reciprocating parts, the maximum upward or tensional force on the connecting rod is about equal to the maximum downward force or pressure, very few keep this fact constantly in mind. It is of great importance in determining the suitability of certain metals for connecting rods. For instance, some of the cast metals have as high a compressive strength as wrought steel and, therefore, if compression stresses had to be withstood only they might be quite as serviceable as steel. However, the stresses on the material of a connecting rod are of an alternating character, and the tensile strength of a metal intended for connecting rods is as important as its compressive strength. This is undoubtedly one of the reasons why cast steel for connecting rods has been discarded. Of course, there is the further objection to it that defects in the castings, such as blowholes, are likely to cause much trouble. For any work where the stresses alternate and where it is desirable to keep down the weight to a minimum a metal of low tensility is not likely to prove satisfactory even though it may be of low specific gravity.

No comparison with the piston is possible, as the conditions of operation are quite different. The mechanical stresses in the piston can be kept down, but there must be provision for rapidly transmitting heat from the piston head to the skirt, which is easier to accomplish with aluminum than with steel.

# Shortening the Power Plant

**I**T is practically universally recognized that engine length, when considered relatively to horsepower output or torque, is decreasing. This is a more important factor than appears on the surface. In the first place, length of engine vitally affects the length of wheelbase required. Given a chassis of a definite wheelbase and a definite weight, which requires a definite horsepower or torque to give satisfactory performance, the shorter the engine the easier it will be for the body designer to provide adequate comfort for the passengers.

The whole development of the powerplant for automobiles has been along lines of greater compactness and at the same time greater output for a given bore and stroke. The adoption of block cast cylinders was one step in this direction which even the increase in sizes did not exactly offset. One of the chief talking points in connection with the V-engine always has been the fact that it requires a minimum length of hood for the displacement and output.

## Present Engines Are Shorter

Taken as a group, the engines employed in 1918 cars are remarkably short as compared with engines of 5 years and more ago. The compactness of design has been secured, of course, through the use of block castings, through compact waterjacket space, through shorter and stiffer crankshafts, V-shaped fan belts instead of flat belts, and in some cases by the utilization of the V-type of radiator, which allows the fan to project inside from 1 to 2 inches.

It is easy to see that with the L-head type of engine, in which the valves are all strung along in a single line, one of the determining factors of engine length is valve size. With the three-bearing type of crankshaft on the four-cylinder engine and the four-bearing type on the six-cylinder engine, the matter of crankshaft design is also a deciding factor. In fact, it is the belief of some engineers that, though shortening of the powerplant saves wheelbase and makes it possible to have a long, roomy body, it is a mistake to skimp on crankshaft bearings. In other words, it is useless to design crankshafts with large pins and large bearings unless there is length enough to make the cheeks of the cranks so that they are in keeping with the large diameter of the pins and bearings. These arguments are, of course, incontrovertible, except for the fact that in a large number of instances engine length is not determined by the crankshaft but by other factors, such as too great a distance between cylinder centers, necessitated by large valve diameters and sometimes even by the mountings of accessories and auxiliaries, such as the generator, fan, water pump, ignition drive, starting motor, etc.

The fact that an engine of the design of the Liberty aircraft type can run under full load for 150 hours and more shows that careful workmanship, coupled with good design, permits of extreme

shortening, while at the same time crankshaft bearing failures are kept down to a minimum. The Liberty engine, from the tip of the propeller hub to the center line of the water heater, measures 69 5/64 in., with a power output of approximately 400 hp. This is remarkably short and sufficiently indicative of the fact that shortening need not be accompanied by structural weakness.

## Overhead Camshaft Improvements

There is little doubt that we will see some marked improvements along the lines of overhead camshaft engines within the next 2 or 3 years. Fully 75 per cent of the engines now down on the drawing boards in designing rooms are of the overhead type. While this type of engine is higher than the L-head, one of its distinct advantages is the possibility for making it appreciably shorter than an L-head type of the same output. The valves are arranged on opposite sides of the cylinders, thus eliminating valve dimensions as a factor in the length of the engine. The camshaft bearings take up no more space than if they were within the crankcase. The valve drive need not take up any more space, and although the height of the engine is greater, this conforms very nicely with modern practice which favors a high, narrow radiator and elimination of the sharp break at the cowl.

With side-by-side valves it is practically impossible to get much shorter engines than we now have. This is evidenced by the fact that in a few instances when it was decided to increase the valve size on certain engines, it was necessary to lengthen the cylinder block slightly to take care of the valve increase. With this condition and with the certainty that the demand for lighter cars with equal passenger space and better performance is going to increase, it is almost sure that some designers will be driven to the overhead camshaft with valves on each side of the engine. The good performance of airplane engines, which require the most refined engineering to produce the greatest torque for a given weight, has certainly vindicated the overhead camshaft type of engine where manufacturers can afford the high class workmanship necessary with this type. It is quite probable that improved design will eliminate the necessity of working to such close limits as are required in aircraft practice. On the other hand, the war has been a great educator, teaching workmen to do their work rapidly and at the same time accurately. This will enable us to build better engines for use in automobiles.

If engines of the old type cannot be redesigned to accommodate them to less hood length, we should start on another tack and design engines of an inherently shorter type. There is no excuse for the production of heavy-weight cars to take four and five passengers when cars of shorter design and improved workmanship can be built which in performance will be far superior.

## Advocate Government Assistance for Development of Commercial Aviation

Annual Report of National Advisory Committee for Aeronautics Suggests Adoption of Comprehensive Policy—  
Great Amount of Investigation Work Started—  
Diesel Aircraft Engine Possibilities Considered

WASHINGTON, Dec. 23—A comprehensive Government policy calculated to develop aircraft construction for both civil and military purposes and to assure the existence of a nucleus of an aircraft industry is advocated in the annual report of the National Advisory Committee for Aeronautics made public here to-day.

Other recommendations resulting from the past year's experiences include a plan of co-operation of military and naval air service to insure continued training in long distance flying and to assist the development of the Aerial Mail Service. Legislation, it is suggested, should be enacted to regulate civil aerial navigation, the issuance of licenses to pilots, inspection of airplanes, uses of landing fields, etc., and such legislation should be drawn to encourage the development of commercial aeronautics. The estimates, states the report, submitted by the War, Navy and Post Office Departments should be given full consideration with a view to placing the United States foremost in the development of aviation for all purposes.

### Investigate 38 Subjects

The report, which deals with the organization and functions of the committee, co-ordination of scientific and research work, technical reports, aeronautic problems and specifications for aeronautic materials, announces that 38 technical discussions will shortly be issued for the general public dealing with general aeronautic problems, including the structure of airplane fabrics, construction of propellers, engine difficulties, sparking, voltage, power characteristics and altitude experiments.

During the past year the committee and its sub-committees have made investigations which will result in the reports mentioned above, and which included inquiries into aircraft designs, studies of types of propellers, combinations of supporting surfaces, available materials of engine construction and special requirements of aircraft structures. A sub-committee on Navigation of Aircraft, Aeronautic Instruments and Accessories was formed, which co-operated with the War and Navy Depart-

ments to improve existing instruments and devise new ones.

New types of aviation engines were made a special study, and a sub-committee is at present investigating the possibilities of developing an aircraft engine embodying features of the Diesel oil engine. Experiments in scavenging two-cycle engines were made which will be continued in the near future. In addition there have been studies in supercharging to maintain power at altitude, improvement of engine details, radiation, carburetor, ignition and fuels and combustion improvements.

### Two New Carburetors

Two types of automatic carburetor control have been developed to such a point, it is stated, that their operation is superior to any available hand adjustment. A third method is now under development and promises excellent results. An engine has been equipped with a new form of apparatus which determines absolute value of the rate of flame propagation in the study of fuels and combustion, and which it is expected will also measure the rate of combustion. Three special gas engine indicators have been under development. A greatly improved and simplified form of optical indicator of the polar type has been designed which it is expected will aid to obtain pressure diagrams of great accuracy.

An altitude laboratory has been constructed and has been in continuous operation throughout the year. Observations have been made on the effect of fuel composition on engine performance, changes of horsepower with altitude, changes of horsepower with speed at different altitudes, performance of carburetors at varying altitudes, heat distribution in engines, effect of supercharging and the effect of compression ratio on horsepower at different altitudes.

The sub-committee on Standardization and Investigation of Materials for Aircraft has conducted experiments on airplane wing beams, wing ribs and wing coverings, impact tests, variable chamber wing, steel construction for aircraft, etc. The results of these tests will be made public in the technical reports to

be issued later. The substitution of steel or other metal for spruce in airplane wings resulted in construction of two complete sets of metal wings made of steel ribs and aluminum alloy beams, the ailerons being entirely of steel. These were tested at McCook Field, Dayton, and proved satisfactory.

Instruments are now being developed for recording in the air the torque and revolutions per minute of the engine, the thrust of the propeller, air speed, angle of attack and the inclination of the wing chord to the true horizon, and it is proposed to use such instruments to determine power plant performance and the relations in the air between the lift drag, air speed and angle of attack.

The work already started by the Weather Bureau in the study of aeronautic atmospheric conditions and the daily reports on them is being furthered by a sub-committee on the Relation of the Atmosphere to Aeronautics. Papers on meteorology and aeronautics, mean values of free air barometric and vapor pressures, temperatures and densities over the United States, and the turning of winds with altitude have been prepared and distributed to the Aviation and Artillery Services. Special experimental tests and kite flights have been made at the various flying fields. Pilot balloon observations are made daily at military stations.

### New Wind Tunnel Constructed

A description of the wind tunnel built for experimental purposes by the committee is included in the report. The tunnel building is brick and steel 43 ft. wide, 90 ft. long and 30 ft. high. It will house a 5 ft. modified Eiffel type of wind tunnel which has been designed to provide for lessening the diameter of the wind stream to 30 in. for high velocity investigations.

When operating with the 5-ft. section the air stream is left open across the operating room, and when operating with the 30 in. section the stream is enclosed as in the National Physical Laboratory type of tunnel. The wind tunnel proper will be equipped with a thrust torque dynamometer for propeller investigations and for determining the effect of the fuselage form upon propeller efficiency; also an aerodynamic balance for making accurate measurements on aerofoils.

(Continued on page 1119)

### S. A. E. Victory Dinner Feb. 6

NEW YORK, Dec. 23—The Society of Automotive Engineers has set the date of Thursday, Feb. 6, for its Victory dinner. It will be held at the Hotel Astor, New York.

# Automotive Industries □

## May Make and Sell "B" Parts

### Producers Given This Permission, But Must Maintain Government Standards

WASHINGTON, Dec. 23—The Motors and Vehicles Division of the Quartermaster Corps has notified manufacturers of parts for the Class B standardized truck that they may make and sell the parts in the open market and may also make and sell completely assembled vehicles.

However, there are certain strings tied to the proposition and in view of these, various interpretations are placed on the action of the Government. For example, it is stated that the drawings, workmanship and material must be up to government standards; that gages must be maintained accurately and that the Government must be given the right to purchase such parts if an emergency arises.

It is believed that the action has been taken primarily to forestall the possibility of makers putting in claims for excessive amounts through the Court of Adjustment. Another angle is that the Government may perhaps be making a move toward obtaining the benefits of a subsidy plan without putting such a plan actually into effect. Following is the letter which outlines the plan; it was signed by Major A. B. Browne, Chief Truck Section, S. C., U. S. A.:

You are authorized to manufacture and sell parts of the United States Government "B" truck or the complete assembly of the "B" truck chassis commercially, provided that you adhere rigidly to the following:

(a) Firms manufacturing and selling the "B" truck as such for commercial trade must conform rigidly to the drawings, workmanship and materials specified by the Government. Any alterations or variations must be distinctly stated in all commercial literature and publicity.

(b) Gauges used in manufacture of such vehicles, in order to be authentic, must be checked and approved by the Bureau of Standards in Washington, by comparison with the master gauges there on file. Gauges must be maintained at this standard of accuracy.

(c) The Government reserves the right of free access at all stages of manufacture to its accredited inspectors, to see that the provisions of "a" are complied with.

(d) The Motor Transport Corps shall control the designs specifications of the "B" truck and these issued each year shall be authority during that year.

(e) Firms granted permission to manufacture and sell the Class "B" truck or parts must give the Government the right, upon immediate notice, to purchase all or such parts as the Government may desire, or its available and future Class "B" type vehicles, should emergency arise.

(f) The right of export and sales in foreign countries shall be restricted to American manufacturers.

(g) In all the above, where the term Class "B" truck is used, this shall apply—not only to the truck as a whole—but to any assembly unit or part thereof, such as engine,

transmission, electrical equipment, or spare parts, and that as future Government models develop, wherein designs are initiated and controlled by the Government, this policy shall apply likewise to them.

(h) In granting this permission the Government assumes no responsibility and gives no authority under existing or future patent rights.

### Future Air Service

WASHINGTON, Dec. 24—Reports and rumors are numerous here with regard to the future Air Service of the Army. While nothing definite can be said at this time, as the plans of the War Department are kept secret until they will be presented to Congress, current statements are to the effect that the future Army Air Service will be composed of approximately 500 officers and 5000 enlisted men. This would mean about 350 fliers and at the most the maintenance of a fleet of 1000 airplanes. It is said that present plans are for an Army of 400,000 men and if the Air Service in the future is to be proportionate to that maintained with our Army of 2,000,000 men which was 20 per cent, the figure stated above would be slightly below the requirements.

It appears that although the War Department is making its plans for presentation to Congress, these plans hinge on the outcome of the peace conference and the League of Nations, for it is expected that armament may be regulated in size to conform with the requirements of the platform which will be formed as a result of the League of Nations, if one is organized.

### M.A.M.A. Sanctions Boston and Chicago Shows

NEW YORK, Dec. 23—The Motor and Accessory Manufacturers' Association has formally placed its stamp of approval on two automotive expositions. It has sanctioned both the show which will be put on by the Boston Automobile Dealers' Association and the one to be staged by the Chicago Automobile Trade Association. Nothing has been done as yet in the way of issuing any sanction for the show to be staged in Madison Square Garden and the 69th Regiment Armory by the New York dealers. The annual meeting of the M.A.M.A. will be held at the Congress Hotel, Chicago, Jan. 29.

### Ford Publishing Co. Incorporates

LANSING, MICH., Dec. 23—The Dearborn Publishing Company, which is to publish Henry's Ford's newspaper, has been incorporated with a capital stock of \$100,000, all common, and all subscribed and paid for in cash. The shares are \$100 each, and of them Clara J. Ford has 334 and Henry Ford and his son, Edsel B., 333 shares each.

## 5% Motor Truck Tax Eliminated

### Levy on Sale Price of Commercial Vehicles, Trailers and Tractors Cut Out

WASHINGTON, Dec. 24—There probably will be no tax on the price of motor trucks, motor truck trailers or tractors. The Senate Finance Committee has passed the new war revenue bill with this 5 per cent tax eliminated.

The 5 per cent tax on the sale price of passenger cars, motorcycles, parts and accessories remains in the bill, however. But the bill has not been finally passed as yet and it is expected that when it comes up before the general conference of the House and the Senate, a strong recommendation will be made that these taxes, too, be eliminated as being discriminatory against the automobile industry.

The removal of the tax on the sale price of trucks does not free such vehicles from all proposed taxation. There still remains a tax of 5 per cent levied on the amount of business done by the owner of a truck who operates over a fixed route in competition with the rail carriers.

Following the presentation of the bill before the conference of the House and the Senate, it will again be presented to the House and the Senate separately for final action.

### Wright-Martin Buys Simplex

NEW YORK, Dec. 23—As was forecast in AUTOMOTIVE INDUSTRIES last week, the Simplex Automobile Co., New Brunswick, N. J., was bought in by the Wright-Martin Aircraft Corp., which already controlled the company. The move was made merely to simplify the accounting methods of the Wright-Martin company and presages no changes in the Simplex company or its product.

### Mexico Shipped 5,505,834 Bbl. of Oil in November

TAMPICO, MEXICO, Dec. 21—Practically complete figures for the oil shipments from Mexico for the month of November are now available. They show a total of 5,505,834.02 bbl. as compared with 5,834,952.50 for the month of October. Of the November shipments, all were export except 283,589 bbl. by the Aguila Oil Company, which were coastwise.

## October Exports to Latin America

### Month's Figures Show Big Drop—Probably Caused by Transfer of Shipping

NEW YORK, Dec. 21—Although there has been a serious falling off in exports from this port to the various Latin American republics during the month of October, in comparison with the figures for September, the drop loses much of its significance when the fact that all available tonnage during the former month was devoted to transatlantic service. Since then, altered circumstances have relieved the tension in a measure and it is expected that in the near future our shipping facilities to Latin American ports will be more nearly equal to the demands made upon them.

In September the total value of cars, trucks and parts shipped from New York to Latin America was \$1,205,359. In October the total dropped to \$483,923, a falling off of nearly 60 per cent. Cars dropped from 651 to 119, trucks from 70 to 37, and the value of parts from \$306,432 to \$214,100.

A table showing the total exports from New York for the ten months of 1918, ending October, is also published. This shows a total value of exports of \$10,281,871; an average of well over \$1,000,

000 per month. This average further indicates that October exports have been abnormally low.

#### Reclassifying Trade Statistics

WASHINGTON, Dec. 21—A reclassification of import and export statistics is being made by the Bureau of Foreign and Domestic Commerce in co-operation with other Government departments in order to provide a more logical arrangement, to facilitate tabulations and to increase the use of the statistics. The new classification will be on a decimal basis. All commodities are divided into ten main groups. For the purpose of export statistics the subdivision will be carried to four places. For imports the classification will be carried to five places. Rubber will be listed under plant products other than foods and woods. Essential oils will come under the same heading. Iron, steel, copper and lead will come under the group of ores, metals and metal manufactures. Passenger cars, trucks and farm implements, including tractors, will be entered under the heading of machinery, tools and vehicles.

#### Garford Has Highway Department

LIMA, Dec. 21—The Garford Motor Truck Co. has instituted a Department of Highway Development under the management of S. M. Williams, who has been for the last 4 years sales manager for the company.

## Bureau of Mines' Annual Report

### Many Investigations Undertaken and Experiments Planned and Completed

WASHINGTON, Dec. 21—The Bureau of Mines has issued its eighth annual report, which deals briefly with its many activities. The report was written prior to the armistice, and refrains from detail. It is also largely a compilation of work planned in conjunction with the prosecution of the war. Numerous investigations and experiments with ores, gases, petroleum and fuels were planned, and some completed.

An inquiry into manganese conditions developed that in event of shortage a large part of the country's requirements could be met by using low manganese alloys, as there are considerable quantities of low-grade domestic ores available. Investigation also showed that the Cuban output would increase to about 140,000 tons for 1918.

Investigations of possible domestic production of tin pointed to no prospect of any considerable output. An investigation is planned for the near future of the possible use of domestic graphite formed in crucibles.

A petroleum station costing \$50,000 has been erected at Bartlesville, Okla., and will be used for experiments and inquiries into the formation of oil and water emulsions in wells, characteristics of oil sands, and methods of recovering maximum quantities of oil from sand.

Experiments conducted by the Bureau at the plant of the Michigan Smelting & Refining Co., Detroit, on electric brass melting by use of a 1300-pound capacity rocking furnace, showed good metallurgical results, the metal losses being markedly below those obtained by melting in coke-fired crucibles. The power consumption was low and, says the report, if the metal saving be considered, the over-all cost of melting brass and bronze in a rocking furnace is not more than one-third as compared with the coke-fire system under present crucible, fuel and metal prices. Following the experiments, the Michigan Smelting & Refining Co. has put in four 1-ton furnaces and two other Detroit firms have ordered similar equipment.

Experiments are being conducted with the Ordnance Department for preparation of a series of uranium steels, besides tungsten and molybdenum steels for gun liners. Special furnaces are being used, and so far an indirect-arc furnace has been found most suitable.

Volatilization of lead ores has proved successful, and the Bureau is now starting to apply the process to copper ores. The work done thus far is said to be successful.

The Bureau station at Salt Lake City has discovered and perfected methods of treating complex and oxidized ores of zinc. The precipitation of the zinc from

hydrometallurgical solutions, it is said, has been found most simple by the use of zinc sulphate, because a solution is the easiest to produce in practice and offers the least difficulty in successful precipitation. Enough limestone is added to the zinc sulphate to precipitate all of the sulphate as calcium sulphate.

After the limestone an excess of sulphur dioxide is added; this reacts with the zinc sulphate to form soluble acid zinc sulphite and sulphuric acid, the latter being precipitated as calcium sulphate by the limestone. The calcium sulphate is removed by filtration, and the clear filtrate is heated to remove the excess SO<sub>2</sub>, and at the same time form the insoluble normal zinc sulphite. This zinc sulphite is then filtered from the treated solution.

It has been found possible to recover 85 per cent or more of the zinc from the solutions in a zinc product carrying 38 to 43 per cent zinc and less than 2 per cent harmful impurities. On calcination at a low temperature the zinc sulphite breaks up to form SO<sub>2</sub> and nearly pure zinc oxide.

The work on the problem now consists of determining the various factors that affect operation and also any other data that would be of value in the commercial application of the process or make possible an easier estimation of its cost.

As air rapidly oxidized the zinc sulphite to sulphate and hence interfered with precipitation, a laboratory apparatus was developed in which all of the operations necessary will be performed out of contact with the air and in an SO<sub>2</sub> atmosphere.

The work of the Petroleum Division has included examination of 275 samples of fuel oil, representing deliveries amounting to nearly 20,000,000 gal., worth \$800,000. Some 60 samples of lubricating oil, 135 samples of gasoline for trucks and airplanes, and 95 products, including products of special cracking processes, alleged gasoline improvers, etc., were analyzed. This work included tests of German gasoline and other fuels for airplanes both in flying and dynamometer experiments.

#### Airplane Mail Increases 600 Per Cent

WASHINGTON, Dec. 19—Airplane mail has increased 600 per cent during the past month, post office officials announced yesterday. This is attributed to the mailing of Christmas cards by this medium, and also to the rate reduction on 1 oz. of first-class matter from 16 to 6 cents. This is the first Christmas that it has been possible to send a Christmas greeting in this way.

More than 600 pieces of first-class mail were sent by airplane to New York yesterday. Approximately 100 were sent on the corresponding day of last month.

#### Hide Restrictions Off

WASHINGTON, Dec. 21—All restrictions on the importation of hides and skins have been removed by the War Trade Board.

## Aircraft Department Annual Report

### Records Enormous Progress Made in Training Aviation Specialists

WASHINGTON, Dec. 21—An appeal, by Premier Clemenceau of France, for 2000 planes a month, 5000 pilots and 50,000 mechanics, was the cause of the appropriation of \$640,000,000, according to a statement in the annual report, Department of Military Aeronautics, made public here recently. The appeal of the French premier was received May 24, 1917, and within 60 days Congress passed the appropriation measures.

American army aviators in the United States flew over 30,000,000 miles in a single June week, or 1223 times the distance around the equator, according to the report. Flights were 407,999 hours in the fiscal year as against 745 hours in 1914.

"This country never had trained an aviator sufficiently to meet the demands of overseas aerial warfare," states the report, and "it had not the slightest knowledge of the instruction necessary for radio, photography or the enlisted personnel. Consequently, the first men largely trained themselves before teaching others, and experience led from one course to the next." Despite these handicaps, 4980 men had graduated as reserve military aviators by June 30, 1918, and 110 bombers, 85 bombing pilots, 464 observers, 389 observer pilots and 131 pursuit pilots had been graduated on that date from the advanced training schools.

Fatalities for the year ended June 30, 1918, totaled 152 in training, an average of 1 death for each 2684 training hours or 201,000 miles flown. Stalled engines, usually due to errors by pilots, caused 86 deaths; collisions 30 and side slips 10. The number of fatalities, says the report, averaged less than one-half of those of the larger allied countries.

The first American cadets were sent overseas for training within 6 weeks after the declaration of war, and by the end of 1917, says the report, more than 2500 men had been sent to France, England, Canada and Italy.

"The collapse of Russia and Italy's serious defeat made it impossible," says the report, "unfortunately, for the Allies to meet the training schedules, so that many of these cadets were in idleness for months. Nevertheless, what facilities were available greatly advanced America's aerial preparation and helped relieve the shortage of equipment here.

"It was early in May, 1918, that the first German plane fell a victim to an aviator in the American service. About the same time 468 fully trained American aviators, organized into 13 complete American squadrons with British and French squadrons, were actually on the front taking increasing toll of the enemy."

There were also 440 balloon officers graduated, according to the report, of whom 155 were fully qualified observers, during the fiscal year.

In conclusion, General Kenly states that while at the outset of the war there were but 65 officers in the air service, there were, on June 30, 14,320 and the enlisted strength increased in the same time from 1120 to 124,767, the men in training or waiting training as fliers, from less than 100 to more than 18,000. There were 4,872 officers and 46,667 enlisted men overseas.

Attention is also called in the report to the fact that within two years this country developed its aviation rapidly, installing radio outfits, manufacturing regular bombing planes and developing the Liberty engine.

#### Appropriations for Aircraft Production and Operation

WASHINGTON, Dec. 21—In the appropriations asked of Congress for Air Service, \$164,877,253.18 for the Army and \$225,000,000 for the Navy, provision is made allowing \$19,933,738.47 for Army aeronautics operations and \$144,943,514.71 for Army aeronautics production.

#### Government to Sell Airplanes

WASHINGTON, Dec. 21—The Department of Military Aeronautics plans to sell several hundred airplanes and engines on the open market. These are planes that have served their purpose as training ships, and it is believed there will be ready purchasers for them. It is expected that the sale to private owners will do much to popularize flying in the United States. Another possible market for more of these planes includes the nations of South America and other countries favorable to the Allies. The Czecho-Slav Government has already purchased 25 L. W. F. airplanes.

#### Deeds Presented with Testimonial

WASHINGTON, Dec. 21—Col. Edward A. Deeds was presented with an engrossed testimonial by Col. Sidney D. Waldon on behalf of the original Equipment Division of the Signal Corps at a banquet in his honor at the Army and Navy Club last night. More than 100 high ranking officers, Government officials and aircraft manufacturers were present. The testimonial, bearing the insignia of the Air Service and the Signal Corps, expressed the confidence and esteem of the officers who were associated with Col. Deeds in determining the aircraft policies on which the Air Service was built. Major General George O. Squier, originally head of the Army Air Service, briefly described how it had been formed, and the class of men that made up its personnel. Brig. Gen. J. D. Cormack praised the Equipment Division and told of the difficulties it had to encounter. Seated at the speaker's table with Col. Deeds were Assistant Secretary of War Benedict Crowell, General Cormack, General Squier, Admiral D. W. Taylor, Orville Wright, Lt. Col. L. S. Horner and W. C. Potter.

## Bill Would Legalize Contracts

Congressman Dent's Measure Provides Payment for Contracts "Illegally" Made

WASHINGTON, Dec. 23—A new bill has been drawn up by Congressman Dent authorizing the Treasury Department to pay manufacturers who hold Government war contracts which were not "legally" executed and which have been held up by a decision of the Controller of the Treasury. The bill restricts the authority of the Secretary of War considerably as compared with the first bill which was drawn up.

It provides that on June 30, 1919, a detailed statement must be presented to Congress by the Secretary of War showing the terms and nature of the contracts which will be paid under the authorization of the bill. It eliminates payments for contracts made during the war and not "legally" executed to June 30, 1919. It does not relieve any officer or agent of the Government from criminal prosecution and provides that the Government may prosecute regardless of provisions if fraud is found.

The names of all contractors and the amounts of the payments to them must be filed with the Clerk of the House and printed in the Congressional Record or Official Bulletin 10 days before the payment is authorized. It was expected that Congress would take action on the bill to-day, but other business prevented this, and it may come up for action to-morrow or be held over the holidays. Following is the complete bill:

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

"That the Secretary of War be, and he is hereby, authorized to adjust, pay, or discharge any agreement, express or implied, upon the basis of reasonable value but in no case greater than the agreed price that has been entered into, in good faith during the present emergency and prior to November 12, 1918, by an officer or agent acting under his authority, direction, or instruction, with any person, firm, or corporation for the acquisition of lands, or the use thereof, or for any supplies, material, or equipment to be used in the prosecution of the war, when such agreement has been executed in whole or in part, or expenditures have been made or obligations incurred upon the faith of the same by any such person, firm, or corporation prior to November 12, 1918, and such agreement has not been executed in the manner prescribed by law:

"Provided, that payment under such agreement shall not exceed the fair value of the property transferred or delivered and accepted by the United States, as determined by the Secretary of War, and where no property has been transferred or delivered, or accepted payment shall not be in excess of the actual cost incurred in preparation for performance, as such cost is determined by said Secretary:

"Provided further, That this Act shall not authorize payment to be made of any claim under such agreements after June 30, 1919:

"And provided further, That the Secretary of War shall report to Congress at the beginning of its next session following June 30, 1919, a detailed statement showing the nature, terms, and conditions of every such agreement and the payment or adjustment thereof:

"And provided further, That nothing in this Act shall be construed to confer jurisdiction upon any court to entertain a suit against the United States upon any agreement of the character herein provided for:

"And provided further, That no settlement of any claim arising under any such agreement shall bar the United States Government through any of its duly authorized agencies, or any committee of Congress hereafter duly appointed, from the right of review of such settlement, nor the right of recovery of any money paid by the Government to any party under any settlement entered into, or payment made under the provisions of this Act, if the Government has been defrauded, and the right of recovery in all such cases shall extend to the executors, administrators, heirs, and assigns, or any party or parties:

"And provided further, That nothing in this Act shall be construed to relieve any officer or agent of the United States from criminal prosecution under the provisions of any statutes of the United States for any fraud or criminal conduct:

"And provided further, That this Act shall in no way relieve or excuse any officer or his agent from such criminal prosecution because of any irregularity or illegality in the manner of the execution of such agreement:

"And provided further, That the names of such contractors and the amounts of such partial or final settlements shall be filed with the Clerk of the House for the information of Congress and printed in the Congressional Record, or in the Official Bulletin, or as a public document, 10 days before confirmation and payment is authorized upon such contracts."

### Menohar Made Aircraft Head

WASHINGTON, Dec. 23—Major General C. T. Menohar, who has been in command of the Rainbow Division in France, is returning to the United States to become Director of the Bureau of Aircraft Production. Col. James A. Mars, who is at present Director of Aircraft Production, as was announced last week, succeeding W. C. Potter in this position, will probably be made the Assistant Director under General Menohar.

The appointment of General Menohar probably means that the Bureau of Aircraft Production will be made a part of the regular military organization, and probably General Menohar will be assigned to the General Staff to effect this co-ordination. This would mean a continuation of two separate air divisions—one for production and one for operation, with the latter under Major General Kenly. Heretofore the Bureau of Aircraft Production has been chiefly a civilian department. It was operated originally as the Aircraft Production Board in conjunction with the Equipment Division of the Signal Corps, and at that time was headed by civilians, including Howard E. Coffin and W. C. Potter. With the reorganization last spring, when the Bureau of Aircraft Production was formed, John D. Ryan was appointed to head it with W. C. Potter as Assistant Chief, both civilians.

### War Industries Board Withdraws All Pledges

WASHINGTON, Dec. 20—All restrictions and orders of the War Industries Board and all pledges given to the War Industries Board by industries are canceled, effective Jan. 1, 1919, according to formal announcement made to-day by the board. This means that all restrictions in the purchase of steel and other commodities and in the manufacture of passenger cars, motor trucks and other automotive products and accessories are completely removed and normal peacetime business can resume with the New Year.

## 39 Aero Squadrons in Service

United States Had This Many on the Front When the Armistice Was Signed

WASHINGTON, Dec. 23—On Nov. 11, when the armistice was signed, there were 39 American aero squadrons distributed on the front, including 20 pursuit, one night bombardment, six day bombardment, five Army observation, 12 corps observation and one night observation squadron.

American fliers brought down 491 confirmed and 354 non-confirmed enemy planes up to that day, a total of 845. During the same period the American forces lost 271 planes. Eighty-two enemy balloons were destroyed as against 45 American balloons.

The American air service in the front zone included 2161 officers and 22,351 soldiers, a total of 24,512. During the period between Sept. 12, 1917, and Nov. 16, 1918, the A. E. F. received from all sources 3337 service planes and 90 school planes for pursuit, 421 service planes and 85 school planes for day bombing, 3421 service planes and 664 school planes for observation and 31 planes for night reconnaissance in addition to 2385 training planes, 30 experimental planes and 108 miscellaneous.

Eight different schools under American control were established in France and designed for training 3800 officers and 11,700 men, as follows:

Tours—Observers:	916 officers
	2121 soldiers
Issoudun—General Flying:	2175 officers
	6100 soldiers
Clermont—Ferrand—Bombardment:	120 officers
	660 soldiers
St. Jean-De-Monte—Aerial Gunners:	92 officers
	1500 soldiers
Meucon—Artillery Firing Point:	20 officers
	110 soldiers
Chatillon-sur-Seine—Observers:	204 officers
	383 soldiers
Souge—Artillery Firing Point:	259 officers
	750 soldiers
Coetquidan—Artillery Firing Point:	25 officers
	120 soldiers

### England Lightens Driving Restrictions

LONDON, ENGLAND, Dec. 1—By mail—England has partly removed the restriction on the use of motor cars and trucks by private owners. Effective to-day owners are permitted to drive free of restraint to the limit of the gasoline allowance and within a thirty mile radius of London. It is still necessary for those who buy gasoline to have permits from the Petrol Control Department. It is expected however that the necessity for such permits will soon cease to exist owing to the fact that military use of gasoline is very rapidly decreasing and imports are increasing.

*French army trucks being overhauled preparatory to being sold. In this lot of war-worn vehicles are a number of captured German Mercedes*

## French War - Worn Vehicles Sold

**Government Has Realized \$6,000,000 for 2789 Trucks, 2884 Cars and 1826 Motorcycles**

By W. F. Bradley

PARIS, Nov. 20—A year before the war came to a close the French Army inaugurated a system for placing its surplus automobiles and trucks at the disposal of the public. Up to the present date these sales of war-worn automobiles have enriched the State treasury to the extent of more than \$6,000,000. The sales cover 1134 trucks, 1655 light trucks, 2884 touring cars, 1826 motorcycles and 2145 units such as motors, transmissions, etc. Thus 7499 automobiles have been placed at the disposal of civilian users at a time when transportation is most urgently needed.

A big exhibition ground has been established on the Champ de Mars, immediately behind the Eiffel Tower, and on this ground every kind of gasoline propelled vehicle from a single-cylinder motorcycle to a 10-ton artillery tractor can be purchased. All the automobiles offered for sale are unfit for further service with the armies in the field. While they are defective in some way, they are far from being totally disabled. The French plan is not to sell junk, but to put at the disposal of the public old vehicles which can be patched up so as to give very satisfactory service in civilian life.

These automobiles are picked out of the huge reception park in which the cast-off material from the army is received. A small group of experts decides which of these vehicles shall be turned over for sale, and which shall be disassembled for parts or repaired to go into use with the army service of supply.

In picking out the vehicles to be sold

the experts first of all take the odd cars or the odd models—cars or types which are not used to any great extent in the service. All the old type powerful touring cars, of 1910, 1911 and 1912 vintage, are eliminated. Most of the captured German automobiles are turned over for sale; cars and trucks which have not given very great satisfaction in war work are got rid of; finally the more modern vehicles are sold when there is a plentiful supply to be obtained from the factory.

As proof that the cars are not all junk, Louis Wagner's Mercedes, which won second place in the last French Grand Prix, is now in the exhibition ground for sale, and it is known when it passes into private service it will change hands at not less than \$12,000, which is a higher price than some of the racing Peugeots were sold for in 1913 and 1914.

When cars and trucks are sent to the

exhibition ground they are cleaned up and painted by army mechanics and made to present as good an appearance as possible. Usually once a week there is a public sale, and for about ten days before this sale every automobile can be examined in detail.

The entire sales organization is in the hands of Lieutenant Paris, a French automobile officer, who fixes a limit price for each truck or car. The public is invited to make bids in sealed envelopes, the highest bid received being the one accepted. Not more than 2 per cent of the automobiles are unsold.

Certain bodies, including municipal councils, government departments, charitable organizations, are allowed preferential bids. These are opened before the bids made by the general public, and, provided the minimum is offered, are sold to these bodies. There is no guarantee that the cars and trucks are in good running condition. Generally they have to be towed home. But provision is made to supply spare parts by stripping down certain chassis and letting the purchasers of trucks and cars have a prior right on these parts.

Many of these trucks are bought up by mechanics as a mere matter of speculation. In other cases the prospective purchaser gets in touch with a small mechanic and arranges with him to carry out the necessary work if purchase is concluded. Horses are so scarce in France and the automobile factories are so busy on war orders that these war-worn trucks are sold for almost as much as when they were new.

### Tractors in Scotland

WASHINGTON, Dec. 19—More than 17,000 acres have been plowed, 2500 acres cultivated, 5000 acres grubbed and 4300 acres harrowed in Scotland as a result of the use of farm tractors during the last season, according to a Commerce report.

*Steam trucks used before the war by a sugar refinery, employed behind the lines since 1914 and now offered for sale*

# Petroleum Demand Will Increase

## Mining Engineers Told of Necessity for Extensive Investigation and Development

WASHINGTON, Dec. 21—The demand for petroleum, increased during the war times, will continue and grow in the future, and to meet the requirements and maintain its place as a petroleum producer, the United States must carry on extensive work in the improvement of producing, storing and shipping and refining of petroleum, and must develop every possible resource.

These were the most important messages given to the American Institute of Mining Engineers at its first annual meeting held here this week, by Chester Naramore, Chief of the Petroleum Division, Bureau of Mines, Department of the Interior. Mr. Naramore, who has just returned from a visit of several months to Europe, where he aided the Allies to secure sufficient petroleum, stated that for the past several years the United States has produced 65 per cent of the world's crude petroleum, reaching 335,000,000 bbl. in 1917, an amount equal to 60 per cent of the total world's yield. In 1917 Russia was our nearest competitor with a production of 14 per cent, while Mexico, considered the bonanza of the oil world, produced but 11 per cent.

### Should Invest in Foreign Fields

Tanker tonnage, said Mr. Naramore, gained 50 per cent since the first months of 1917 with a total dead weight of 1,360,000 tons on Nov. 15, 1918. And this, he stated, is fortunate because there will be an increased demand for gasoline and lubricants for internal combustion engines both at home and abroad.

American producers and American capitalists, said Mr. Naramore, must invest capital in other sections of the globe, must develop oil wells wherever they exist, and in that way only, he stated, can they hope to meet the huge demand that will come in the future and, further, in that way only can they hope to maintain and increase the tractor, truck, passenger car, airplane and oil burning boat industries of the United States.

He holds out but little hope of securing oil from oil shale, principally because of the high cost of extraction, and insists that "this country must in the future depend upon foreign fields to meet a considerable part of the demand that will be made."

"As a source of power," stated Mr. Naramore, "petroleum functioned in all the important mechanical contrivances that stand out as factors of the war, on land, water or in the air. Eliminate petroleum and you eliminate the submarine, the fast destroyers, the best battleships, the automobile, the tractor, the motor ambulance, the motor truck and the aircraft. The airplane, the submarine and the tank each stands forth clearly in the average man's picture of recent great events, but to those whose duty it was to supply the fuel it is clearly evident that the humble motor truck functioned to an extent not measurable in any but superlative terms.

"Trucks, trucks, and more trucks, ever

present from the channel ports to the Adriatic, constituting a main artery that carried the life blood of the army, whether in men, munitions or supplies.

"But how does that apply in a paper on petroleum and reconstruction problems? Tremendously—because it means when the troops return the greatly increased use of the motor truck for every conceivable future transport problem both in Europe and America; yes, and in South Africa and Australia.

"This leads directly to the third point under discussion, that is, the probable future requirements of petroleum products, as well as the possibilities of meeting them.

"Previous to the war, apparently the only limit to the number of motor cars absorbed by the public was the number which the automobile industry could build. The motor truck, on the other hand, had proved its worth most conspicuously in our commercial centers; the millions of men across the sea who represent the best blood of each nation have become accustomed to depending upon the long trains of motor lorries for their every want. Accordingly, when they return home they will automatically think of transport problems in terms of truck loads as well as tons.

### Truck Demands Good Roads

"Consider this universal use of trucks with the unrestricted manufacture of automobiles, and the problem from an engineer's point of view becomes one of unlimited road building. Good roads, with permanent bridges and new regulations as to road maintenance and repair, must materialize. In fact, it means a complete revolution in the attitude of many communities toward expenditures for roads that will stand the traffic wear of fast moving 4 and 5-ton (and even larger) trucks. Many of the so-called permanent highways, of which certain states are so justly proud, are permanent only in a relative sense, and even though they represent expenditure of millions they will not be found serviceable for severe freight transport. I will let your fancy picture the further problems immediately ahead in the fields of engineering, financing and maintenance.

"Tractors are merely another branch of the one great field of automotive endeavor and their more extensive use is an assured fact. Their successful adaptation to farm use will spread with increasing rapidity as the knowledge of the internal combustion motor becomes more and more general.

"To guarantee the perpetuation of the several tremendous industries in which the internal combustion motor functions, including automobile trucks, tractors, motor boats and aircraft, an unlimited supply of petroleum is a basic necessity, and to further guarantee the life of the above industries a campaign for the conservation of petroleum products should be continued and needless losses should be prevented.

"The popular conception that there will be a permanent decrease in the demands of petroleum after the signing of peace is erroneous. Bear in mind for a moment that in France and England for the past year every gallon of gasoline used has been for war purposes, and every day was a gasolineless day. With the lifting of this ban undoubtedly any surplus of gasoline will be readily consumed by the civilian population. We are at once confronted with the problem, How will the industry meet the future demands for petroleum? A great many men have predicted in the past that each year the maximum production would be reached, and it seems very obvious to those who are close students of the game that we cannot expect any material increase in production over that of the present year, 1918. To our best knowledge, outside of northern Texas, certain parts of Oklahoma and Wyoming, the oil fields of the United States have been explored to a very large extent. Optimistically assumed that the production will remain constant for the next several years, and assume that consumption will not increase for the next few years. How then will we make up the deficit of 52,000,000 bbl. as of 1917, 21,000,000 bbl. of which were drawn from storage and 31,000,000 bbl. imported from foreign fields, chiefly Mexico?

### Extensive Research Work Essential

"With such a shortage and no probable increase in home production, it is very evident that to meet the shortage we must first of all obtain from petroleum a maximum recovery and a minimum loss. Extensive research work should be carried on in order to improve the art of producing, storing, shipping and refining of petroleum and to develop possible unknown and better uses of this wonderful natural resource that it might still further serve mankind.

It has been suggested by a great many writers that oil shale will solve the problem of the world's demands, but we should bear

in mind that this industry is in a decidedly experimental stage with need for extensive research work. The solution is not a simple one when we consider that on a basis of a barrel of oil to a ton of shale, 1000 bbl. of crude oil output per day requires on the roughest kind of an estimate an initial investment of approximately \$1,000,000. It is primarily a moneyed man's undertaking and with such heavy initial expense its development will be very slow. Hence we cannot look upon the oil shale industry as a solution of our nation's needs within the next few years. This industry has its place, of course, in the American problems and I do not intend to minimize in any way the attention that should be given to development of oil shale.

"In spite of our very best efforts for conservation and a maximum recovery from the oil produced, it is very evident that this country must in the future depend upon foreign fields to meet a considerable part of the demand that will be made.

"Moreover, because of the universally recognized importance of petroleum as a prime factor of national defense, we must expect every first-class nation to endeavor to control as much crude production as possible, in order that they may be less dependent upon the United States. In view of this, I would consider it little less than a national calamity if American capital should fail to develop the potential petroleum resources contiguous to the Gulf of Mexico, the Caribbean Sea and those of South America.

"The control of the crude oil production of the world is often thought of as a battle between giant corporations, one in America and the other a Dutch-British unit, but the control means more than division of profits between rival business concerns. It means fuel, and fuel is power, and national security as well as prosperity.

"It is true that our domestic production has been able to supply two-thirds of the world's consumption, but petroleum is a wasting resource, and in this country because of its accessibility and proximity to industrial centers we have already drawn heavily upon our total supply as we approach the dawn of a tremendous era of petroleum expenditure.

"With the facts as outlined in my earlier remarks thoroughly known and appreciated by the powers of Europe, it will indeed be surprising if every encouragement is not furnished the different representatives of the petroleum industry by their respective governments to extend their holdings the world over. This assistance may even assume the form of active government investment in petroleum reserves.

"Accordingly, with American interest thoroughly entrenched in the prolific fields of Mexico, it is to be earnestly hoped that they will not find it necessary to sell to foreign capital, but will be able to further increase their holdings in these fields, which are so accessible to the states.

"Furthermore, if the tremendous effort of this country to establish a merchant marine is to bear its maximum rewards, the ships must be provided with oil from nearby sources to reduce the long haul cost. To this end it would be well if American capital did not limit its activity to this hemisphere, but participated in exploration and development work even to more distant parts of the globe.

"Nationally speaking, it is a question to ponder over, when one considers that American geologists are locating prospective fields and American drillers are developing petroleum reserves the world over FOR FOREIGN CAPITAL. May I leave that one thought with you as of first importance?"

### Detroit Show March 1-8

DETROIT, Dec. 21—Detroit's eighteenth annual automobile show will be held from March 1 to March 8. It will be given in the Crosstown Garage building, which is a new garage completed during the year and which offers the greatest amount of space yet provided for a Detroit Automobile Show. The show is staged by the Detroit Automobile Dealers' Association and owing to the fact that a better show building is now available, it is expected that the show will far exceed anything ever held in this city. The Detroit Dealers' Association has established show headquarters in the Hotel Statler with H. H. Shuart, who has managed Detroit shows for the last years, in charge of the exhibition.

**Transport Truck in Production**

MT. PLEASANT, MICH., Dec. 23—The Transport Motor Truck Co. has entered into active production and has completed arrangements for distribution in most of the large trade centers. The company, which is headed by Milton A. Holmes, is to market a 2½-ton internal-gear drive truck equipped with a Continental engine, Eisemann magneto, Stromberg carburetor, Fuller clutch and gear-set, Columbia front axle, Jacox steering gear and Prudden wheels. The wheel-base will be 150 in. and equipment is to include a Motometer and a Hub-odometer.

**Receiver for Nilson Tractor**

MINNEAPOLIS, Dec. 21—The Nilson Tractor Co. has been placed in the hands of a friendly receiver at the request of its own stockholders and directors. The court has appointed M. J. Osborn, who has been general manager of the company. The receivership is a temporary matter and is the first step in a re-financing and reorganization plan from which the company hopes to emerge bigger and stronger.

**Chicago Office for Lancaster**

CHICAGO, Dec. 21—The Lancaster Steel Products Co. has opened a western office in the United Motors Building at 2715 South Michigan Avenue. Frank N. Adgate, who has been connected with the mills at Lancaster, Pa., has been placed in charge of this office.

**Willard Opens Boston Branch**

BOSTON, Dec. 22—The Willard Storage Battery Co., Cleveland, has opened a branch at Boston to cover the New England territory. It has leased a portion of the large Garford building on Commonwealth Avenue, and has sent J. J. Kennealy, one of the factory officials, on to take charge of the plant.

**Turner Tractors for Italy**

MILWAUKEE, Dec. 23—The Turner Mfg. Co., Port Washington, Wis., manufacturer of the Turner-Simplicity tractor, has booked an order for several hundred machines for exportation to Italy. It will require 100 flat cars to ship the order from the factory to the seaboard. The plant is now working on the contract, which will require several months to fill.

**La Crosse May Ad**

LA CROSSE, WIS., Dec. 23—It is reported that the La Crosse Tractor Co., La Crosse, Wis., manufacturer of the Happy Farmer tractor, is contemplating an important plant enlargement project, involving about \$100,000 in buildings and machinery.

**Perfex Radiator to Build**

RACINE, WIS., Dec. 23—The Perfex Radiator Co., Racine, Wis., manufacturing motor car, truck and tractor radiators and cooling systems, intends to start work shortly on its new \$100,000 plant

**Current News of  
Factories***Notes of New Plants—Old  
Ones Enlarged*

in Racine, which project has been delayed by war conditions. The company has been cramped for room for a long time and its present orders largely exceed the capacity.

**Maibohm Will Rebuild**

RACINE, WIS., Dec. 23—The Maibohm Motors Co., which suffered a heavy loss by fire in its plant recently, is making arrangements to build a new factory costing about \$100,000 without equipment. The main building will be 80 x 600 one story high, of steel and brick construction, with steel sash. The contract probably will be awarded to the Austin Co., Cleveland.

**Gehl Increases Facilities**

MILWAUKEE, WIS., Dec. 23—The Gehl Bros. Mfg. Co., West Bend, Wis., manufacturing gas engines, tractors and agricultural machinery, is increasing its manufacturing facilities about 25 per cent. A second floor has been added to the erecting shop for office purposes. The former office and storehouse have been converted into a machine shop addition.

**Can Export Rubber Goods**

WASHINGTON, Dec. 23—Restrictions upon the exportation of manufactured rubber goods have been removed and licenses will now be issued freely.

**Embargo on Importation Into India  
Withdrawn**

WASHINGTON, Dec. 20—The embargo on the importation into India of automobiles, motorcycles and accessories has been withdrawn. The Government of India has given official notification of this withdrawal.

**Triple Tread To Start**

MILWAUKEE, WIS., Dec. 2—The Triple Tread Tire Co., Chicago, an Illinois corporation, with a capital stock of \$362,236, has filed articles and a statement to do business in Wisconsin. The local headquarters are in Platteville, Wis., and the Wisconsin interest is given as \$25,000.

**Dividends Declared**

Ajax Rubber Co., quarterly, \$1.50.  
Packard Motor Car Co., quarterly, 1% per cent preferred stock.  
Pierce-Arrow Motor Car Co., quarterly, 2 per cent preferred stock.

**Newman to Bring Out Truck Line**

ST. LOUIS, Dec. 23—Harry Newman, Inc., a truck and trailer distributor here, will on Jan. 15 begin production of a standard truck in five sizes, ranging from 1 to 5 tons. He has contracted for such parts as Timken-Detroit worm drive rear axle, Continental Red Seal motor, Stromberg carburetor, A. O. Smith frame, Borg & Beck clutch, and Gemmer steering apparatus. He has obtained factory space necessary for a large output. The trucks will sell from \$1,590 to \$4,190.

**Fansteel Moves New York Office**

NEW YORK, Dec. 21—The Fansteel Products Co., North Chicago, has relocated its New York headquarters in the Park Row Building, 15 Park Row.

**Philadelphia Office for Hess**

BALTIMORE, Dec. 21—The Hess Steel Corp. has established a branch office at 517 Widener Building, Philadelphia. Charles O. Rowe, district representative, will be in charge.

**Northern Foundry Increases Capital**

MARINETTE, WIS., Dec. 23—The Northern Foundry Co., Marinette, Wis., organized a year ago to specialize in gray iron castings for the automotive industry, has increased its capital stock from \$25,000 to \$95,000. The company is completing enlargements which will double the capacity. Besides erecting an addition, it has taken over the plant of the Landover Motor Truck Co., Marinette, and this concern has taken new quarters at Stephenson and Liberty streets. At the annual meeting of stockholders, the Northern company re-elected these officers: President and general manager, J. M. Fitzpatrick; vice-president, Patrick McManus, Milwaukee; secretary, Edward J. Vanderboom, Milwaukee; treasurer, Louis E. Best, Milwaukee.

**Open New Brass Foundry**

SUPERIOR, WIS., Dec. 23—A new brass foundry has been opened at Superior, Wis., by G. W. Nelson, formerly engaged in this business at Cumming Avenue and Second Street in this city. Nelson has leased the plant until recently occupied by the Acme Foundry Co., which is now located in its new shops.

**Air Mail Service in New Zealand**

WASHINGTON, Dec. 23—An aerial mail service will be established shortly in New Zealand from Auckland to Dunedin, a distance of 700 miles, according to a Commerce Report. It is expected that a saving of 14 hours will be effected.

**Export Conservation List Modified**

WASHINGTON, Dec. 23—The War Trade Board has modified its export conservation list, removing among other commodities, airplane duck cotton and rubberized silk for use in aircraft manufacture.

### Williams Again Heads Highways Industries Association

CHICAGO, Dec. 21—S. M. Williams of the Garford Motor Truck Co., was re-elected president of the Highways Industries Association at the annual meeting held here last Friday. Other officers elected were: First vice-president, G. P. Coleman, chief engineer, Highways Department, West Virginia; second vice-president, E. J. Mehren, editor, Engineering News-Record; third vice-president, Charles J. Lang; secretary and treasurer, H. G. Shirley; directors (Class A membership), W. P. Blair, National Paving Brick Association; A. T. Rhode, Granite Pavement Block Manufacturers' Association; E. J. Mehren, National Association Asphalt Block Manufacturers; W. T. White, N. A. C. C.; directors (two years), W. E. Metzger, E. J. Sutton, A. P. Sandles, Philip Koehring; directors (three years), H. J. Love, W. O. Rutherford, A. N. Johnson, S. F. Beatty. David S. Ludlum, president of the Autocar Co., Ardmore, Pa., was elected to Class B membership. The following national associations have made application for Class A membership: National Vitrified Pipe Manufacturers' Association, the Lime Association.

M. Frankel, manager of the Chicago office of the Roller-Smith Co., maker of electrical instruments, has been promoted to assistant sales manager of the company, with headquarters at Chicago.

G. W. Werden has been appointed export manager of the Denby Motor Truck Co., Detroit. He has established headquarters in New York City.

H. W. Clark has been appointed manager of advertising for the Chicago Pneumatic Tool Co., Chicago. He was formerly in the advertising service department of the McGraw-Hill Publishing Co. in Chicago.

### Government Help For Aviation

(Continued from page 1110)

Both the balance and the dynamometer will be suspended from an overhead platform into the wind stream. In each case the observer will work above the platform. Power will be supplied to the wind tunnel propeller by a 250 hp. motor, which will be operated by a 250 kw. synchronous motor generator set with special arrangements for speed control and regulations.

The wind tunnel is designed for air velocities up to 130 m.p.h. with the 5 ft. section and 200 or more miles per hour when using the 30 in. section.

During the past year the committee has served the War and Navy Departments as an impartial agency for the settlement of disputes between contractors and the departments. Among the more prominent cases handled were:

A dispute between the War and Navy Departments on one hand and the Kessler Motor Co. relative to compliance with technical provisions of a contract for de-

## Men of the Industry

### Changes in Personnel and Position

velopment of experimental aircraft engines.

The contract with the Glenn L. Martin Co. for a large bombing plane with a smaller pilot plane fastened to it so as to automatically control the large plane and direct its course after the smaller pilot plane had been released, the larger plane to carry and automatically release a large bomb of the type invented by Lester P. Barlow. A contract had been completed at an expenditure of \$15,000 and a controversy arose over the advisability of expending an additional \$150,000. The committee advised against it.

Sand loading and other tests made by members of the committee's technical staff on an experimental plane built by the Carolina Aircraft Co. revealed the ability of wood veneer in wing construction not only for ribs but also for the actual wing covering. It was found that the internal drift wires may be eliminated and the same weight per square foot of service obtained as in the ordinary wing. This was reported promptly to the Bureau of Aircraft Production.

Engine fuel investigations during the year have included inquiries into:

- 1—Gasoline direct from crude petroleum without stills, cleaned without use of acid or alkali.
- 2—First distillate of crude benzine cleaned and purified without the use of acid or alkali.
- 3—Natural neutral gasoline.
- 4—Increased yield of straight paraffin gasoline from crude oil.
- 5—Separation of gasoline from crude oil by mechanical means.
- 6—Quality samples of pure paraffin gasoline from crude oil were completed and delivered in July, 1918, and were referred to the Bureau of Standards for tests. This work will be described in detail in a later report.

The membership of the committee as elected on Oct. 10, 1918, includes Dr. John R. Freeman, chairman; Dr. W. F. Stratton, secretary; Dr. Charles D. Walcott, chairman executive committee; Dr. Joseph S. Anes, Dr. William F. Durand, Dr. John F. Hayford, Major General William L. Kenly, Prof. Charles F. Marvin, Dr. Michael I. Pupin, Dr. Wallace C. Sabine, Rear Admiral David W. Taylor, U. S. N.; Commander John H. Towers, U. S. N. The committee is divided into an Executive Committee and sub and special committees. The subcommittees include those for:

- Aircraft Design and Associated Engineering Problems.
- Steel Construction for Aircraft.
- Fireproof Coverings.
- Navigation of Aircraft, Aeronautic Instruments and Accessories.
- Power Plants for Aircraft.
- Fuel Injection Engines.

### Stewart-Warner Engineer Dies

CHICAGO, Dec. 21—John E. Genn, chief engineer of the Stewart-Warner Speedometer Corp., died Dec. 15. He had been connected with the company since its infancy; in fact, was one of its first ten members. He has been successively engineer, assistant chief engineer, chief inspector and chief engineer. He was 35 years old.

John F. Reno, chief engineer of the Root & VanDervoort Engineering Co., East Moline, Ill., died Dec. 19 of pneumonia following an attack of Spanish influenza. Mr. Reno first became connected with the Moline Automobile Co. about twelve years ago and when this company was absorbed by the Root and VanDervoort Co. he continued as chief engineer. He was thirty-five years old.

### Standardization and Investigation of Materials for Aircraft.

#### Light Alloys.

Special committees are on aero torpedos, aircraft communication on airplane mapping, aeronautic bibliography, buildings, laboratories and equipment, civil aerial transport, design, construction and navigation, editorial, free-flight tests, Government relations, direct-lift aircraft, aeronautic nomenclature, personnel, relation of atmosphere to aeronautics, engineering problems.

Following is a list of special publications which will be issued in the near future by the committee:

- 24—Air Flow Through Poppet Valves.
- 25—Nomenclature for Aeronautics.
- 26—The Variation of Yawing Moment Due to Rolling.
- 27—Behavior of Airplanes in Gusts, III.
- 28—The Laws of Air Resistance of Aerofoils.
- 29—General Theory of the Blade Screw.
- 30—Experimental Research on Air Propellers, II.
- 31—Accuracy and Efficiency of Pressure Nozzles.
- 32—An Airplane Tensionometer.
- 33—Luminous Materials.
- 34—Aluminum and Its Light Alloys.
- 35—The Strength of One-Piece, Solid, Built-up, and Laminated Wood Airplane Wing Beams.
- 36—The Structure of Airplane Fabrics.
- 37—Fabric Fastenings.
- 38—Airplane Dopes and Doping.
- 39—The Testing of Balloon Fabrics.
- 40—The Ferrosilicon Process for the Generation of Hydrogen.
- 41—Testing the Balloon Gas.
- 42—A New Process for the Production of Aircraft Engine Fuels.
- 43—Properties of Aerofoil Sections.
- 44—Description of Altitude Laboratory.
- 45—Effect of Compression Ratio, Pressure, Temperature, and Humidity on Power.
- 46—Heat Distribution in an Aircraft Engine.
- 47—Power Characteristics of Fuel for Aircraft Engines.
- 48—Carbureting Conditions Characteristic of Aircraft Engines.
- 49—Metering Characteristics of Carburetors.
- 50—The Junkers-Diesel as an Aircraft Engine.
- 51—Spark Plug Defects and Tests.
- 52—Temperatures in Spark Plugs Having Brass and Steel Shells.
- 53—Properties and Preparation of Ceramic Insulators for Spark Plugs.
- 54—Effect of Pressure and Temperature on the Sparking Voltage.
- 55—Oscillograph Tests of Ignition Systems.
- 56—Heat Energy of Various Ignition Sparks.
- 57—The Series Gap as a Means for Improving Ignition.
- 58—Transformation Ratio and Coupling in High Tension Magnets.
- 59—General Analysis of Airplane Radiator Problems.
- 60—General Discussion of Test Methods for Radiators.
- 61—Head Resistance Due to Radiators.
- 62—Effect of Altitude on Radiator Performance.
- 63—Water Flow Through Radiators.

# Mail Trucks Earn Four Times Their Cost

Cost of Operation Between July 1 and Sept. 30 Was \$70,000, as Compared with \$292,000 Revenue—Post Office to Put 2000 Trucks on 600 Routes

WASHINGTON, Dec. 21—Motor truck mail service costs during the year ended June 30, 1918, were from 30 cents per hour to \$1.26 per hour, depending on the truck and the locality, according to a tabulation of motor truck costs filed by the Post Office Department with the Committee on the Post Office and Post Roads.

The costs varied considerably with the different types and capacities of trucks and again with the localities. For example, a Ford operated in Boston cost 40 cents per hour, in New York 81 cents per hour, and in Washington, D. C., 36 cents per hour. A  $\frac{3}{4}$ -ton White in Boston cost 59 cents per hour, in Nashville 36 cents per hour, in Philadelphia 98 cents per hour, and in Washington, D. C., 49 cents per hour.

## 509 Fords Used

Depreciation and interest rates per annum figured on 16-hour days and 365 days a year range from 20 per cent to 33  $\frac{1}{3}$  per cent. More Ford trucks are in the mail service than any others, totaling 509 as compared with 173  $\frac{3}{4}$ -ton White trucks, and, next, 64 Packard  $\frac{1}{2}$ -ton trucks.

Thirty-one through motor truck routes have been established over 5720.61 miles. The cost of operation for 3 months from July 1, 1918, to Sept. 30, 1918, was \$69,625.75 as compared with a total revenue of \$292,024.95. These figures in additional tables were filed with the Committee on the Post Office and Post Roads by Fourth Assistant Postmaster General James I. Blakeslee to prove the need for the \$1,000,000 appropriation for additional motor truck routes.

Blakeslee stated that the net income totaled \$134,791.72 if the 1-cent war tax was deducted, and in addition 33  $\frac{1}{3}$  per cent should be credited to postal operations other than perfected through the motor truck service, leaving an actual net

income in 3 months of \$89,861.15, or \$1,576.51 per route per month, or a net income of \$18,918.12 per route per annum. The plans of the Post Office are to establish 2000 trucks over 600 routes.

In illustration of the service that motor truck routes had given, Blakeslee stated that on Nov. 13, 1918, 795 lb. of milk was hauled from Frisco, Mo., to Warsaw, Mo. "Points you might say," stated Blakeslee, "of nowhere to nowhere—there is no market at Warsaw, it is a town of no size and Frisco is a village. There is no railroad anywhere in the vicinity of either of these villages." He also stated that 1726 lb. of milk were carried into Washington, D. C., daily by motor trucks.

A "B" type standardized army truck turned over by the War Department, he said, is now operating between Philadelphia and Westchester, Pa., carrying 6000 lb. of mushrooms a trip. Motor truck operators are being paid \$4 a day for the first 6 months, \$4.50 a day for the next 18 months, and \$5 daily thereafter. It would require \$8,794,000 to operate 600 routes with 2000 trucks, said Mr. Blakeslee.

Replies received from 88 postmasters showed increases of one-half of 1 per cent to 500 per cent of postal business due to the establishment of motor truck routes.

Following is the table showing the cost of motor service by districts:

## Substitute for Platinum

WASHINGTON, Dec. 19—A substitute for platinum has been found in the manufacture of sulphuric acid, according to announcement made by the War Industries Board here to-day. The discovery was the result of experiments in the Nellen Institute, Pittsburgh. The exact nature of the substitute has not been revealed. The substitute is not

available to take the place of platinum in the arts or in dentistry, but it may be used later, according to the report, for laboratory and jewelry purposes.

## Oil and Lubricants Purchased

WASHINGTON, Dec. 19 — From April 1 to Nov. 1, 1918, the Oil Branch of the Raw Materials Division of the United States Army purchased \$23,809,584.14 worth of oils and lubricants. This included 111,229,400 gal. and 2,016,076 lb. Some of the principal items purchased and the quantities are as follows:

Article	Gallons	Value
Liberty aero oil.....	1,308,540	\$808,183.66
Lubricating oil, light..	141,375	54,699.49
Lubricating oil, medium	826,544	329,860.61
Lubricating oil, heavy..	619,498	271,597.23
Transmission lubricant.	286,570	92,975.63
Aviation gasoline.....	12,066,414	2,060,119.48
Aviation naphtha.....	3,297,500	1,084,666.25
Fighting naphtha.....	4,021,500	1,657,713.75
Motor gasoline.....	52,374,066	11,885,012.84
Mineral oil.....	1,868,931	298,789.55
Axle grease.....	1,034,343	279,505.14
Fuel oil.....	30,984,134	2,195,463.12
Motorcycle oil.....	166,600	87,601.36
Neatsfoot oil.....	56,005	118,611.25
Neatsfoot oil substitutes	252,500	174,720.00
Road oil.....	652,350	47,479.20

## Indian Service Wants $3\frac{1}{2}$ Ton Truck

WASHINGTON, Dec. 21—The United States Indian Service, Department of Interior, has asked for bids on 1  $3\frac{1}{2}$ -ton truck, worm drive with a steel dump body and hoist. Capacity 7000 lbs., positive pump circulating oil system in combination with constant level splash system, artillery type wood wheels, Timken roller bearings, 36 by 5 single front tires and 40 by 5 dual rear tires are specified. The truck must be fully equipped with lights and tools and the seat frame should be of wood with well ironed and upholstered back and spring upholstered cushion. All bids should be accompanied by specifications and cut of the truck and should be sent to the Asylum for Insane Indians, Canton, South Dakota, no later than Jan. 4, 1919.

## Revenue and Operating Cost of Postal Trucks, July 1 to Sept. 30, 1918

Termini	July		August		September		Total	
	Revenue	Cost	Revenue	Cost	Revenue	Cost	Revenue	Cost
Portland, Worcester	\$6,807.71	\$1,458.67	\$14,751.44	\$1,502.60	\$16,000.82	\$1,467.01	\$37,595.97	\$4,428.28
Worcester, New York	7,070.20	1,875.47	13,000.00	1,893.89	13,477.22	1,940.47	34,229.47	5,709.83

## Progressive Construction in the Naval Aircraft Factory, Philadelphia

*The original manufacturing unit of the Naval Aircraft Factory, Philadelphia, with a ground area of 160,000 sq. ft., is a permanent steel structure of imposing dimensions. It was built and equipped in about 3 months at a cost of \$1,000,000. It has more than 3600 workers, both men and girls, and soon after the factory had produced its first service machine, it began to maintain an output of four a day.*

*Nearly every feasible suggestion has been worked out and im-*

*provements made wherever possible and all this has resulted in the special seaplane model finally developed at League Island—the Model F, deemed the peer of any of the American machines in the war. It has a wingspread of 100 ft., driven at the rate of 100 m.p.h. by two Liberty engines. The propellers are 10½ ft. in diameter. It carries several bombs, a number of machine guns fired from bow and stern, has a wireless and a telephone system and is supplied with carrier pigeons and a crew of four men.*

## Salvage Division Formed

WASHINGTON, Dec. 21—The Salvage Division of the army has been directed by Brig. Gen. R. E. Wood to take charge of all unserviceable or used Government supplies and materials which result from the demobilization of the military forces and are to be sold. This property includes material that cannot be repaired or reclaimed and made serviceable to the army, and second-hand materials which have been used and cannot be sold to better advantage or be repaired. The Salvage Division will determine the method by which sales will be made and the conditions upon which bids will be received. All bids, however, will be accompanied by a guaranty deposit of at least 20 per cent of the amount bid either in cash or certified check. No delivery of property will be made until the full purchase price is paid. A Governing

Sales Board on Unserviceable Property will be appointed to act as a Board of Review with regard to sales of unserviceable property.

## Commerce Department Takes Over War Sections

WASHINGTON, Dec. 21—The Resources and Conversion Section and the Conservation Section, both divisions of the War Industries Board, are to be taken over by the Department of Commerce after Jan. 1, 1919. The Resources and Conversion Section, which has compiled much valuable information about raw materials and plant facilities, will be continued temporarily. The Conservation Section, which was first known as the Commercial Economy Board, will be made a permanent division of the Department. The Conservation Section has

been instrumental in effecting economies in various industries by elimination of unnecessary types, models and styles of commodities. It is the Government division that arranged for the reductions in the sizes and types of passenger car and truck tires and in the types of farm plows.

## Tractor Agency Wanted

WASHINGTON, Dec. 21—The Bureau of Foreign and Domestic Commerce, Department of Commerce, has a request from France for an agency for tractors. Further information can be had by addressing Foreign Trade Opportunity No. 27829. Another inquiry on hand is for an agency for automobile tires in Australia. Further information can be had by addressing Foreign Trade Opportunity No. 27828.

# Calendar

## ENGINEERING

### S. A. E. Meetings 1919

- Jan. 8—Minneapolis Section, S. A. E.—Hotel Radisson. "Governors for Tractors and Truck Engines."
- Feb. 4-6—New York. Winter Meeting. Society of Automotive Engineers, Engineering Societies' Building.
- Feb. 6—Victory Dinner, Hotel Astor, New York.
- Feb. 5—Minneapolis Section, S. A. E.—Hotel Radisson. "Radiator Cooling Fans."
- March 5—Minneapolis Section, S. A. E.—Hotel Radisson. "Tractor Service and Sales."
- April 2—Minneapolis Section, S. A. E.—Hotel Radisson. "Implements Designed for Tractor Belt Power and Their Characteristics."

## MOTOR SHOWS

- Jan. 11-18—Los Angeles, Cal. Automotive Exposition.
- March 1-8—Detroit, Mich. Detroit Automobile Dealers' Assn. H. H. Shuart, Manager.
- Jan. 24-30—Milwaukee, Wis. Eleventh Annual, Milwaukee Automobile Dealers, Inc., Auditorium. Bart J. Ruddle, Manager.
- Jan. 25-Feb. 1—Chicago. Passenger cars, Coliseum.

February—Grand Rapids, Mich. Grand Rapids Automobile Business Assn. E. T. Conlon, Manager.

Feb. 1-15—New York. Automobile Dealers' Assn. Charles A. Stewart, Manager, Hotel Woodward, Broadway and 55th St.

Feb. 2-5—Chicago. Trucks, Coliseum.

Feb. 15-23—Louisville, Ky. Louisville Auto Dealers' Assn.

Feb. 15-23—Newark, N. J. N. J. Auto Exhibition Co. Calude Holgate, Manager.

Feb. 15-22—Minneapolis, Minn. Minneapolis Auto Trade Assn. Walter B. Wilmet, Manager.

Feb. 17-22—Des Moines, Iowa. Tenth Annual, Des Moines Automobile Dealers' Assn. C. G. Van Vliet, Manager.

Feb. 15-22—Albany, N. Y. Albany Automobile Dealers' Assn. State Armory.

Feb. 17-24—Passenger Cars; Feb. 24-27, Trucks—South Bethlehem, Pa. Lehigh Valley Auto Shows Co. J. L. Elliott, Manager.

Feb. 24-March 1—Kansas City, Mo.—Kansas City Motor Dealers' Assn. E. E. Peake, Manager.

March—Great Falls, Mont.—Montana Automobile Distributors' Assn.

March—Philadelphia, Pa. Philadelphia Automobile Trade Assn. Passenger cars.

Mar. 3-8—Columbus, O. Columbus Automobile Show Co. Memorial Building. W. W. Freeman, Manager.

March 3-8—Buffalo, N. Y. Buffalo Automobile Dealers' Assn.

March 1-10—San Francisco, Cal. Motor Car Dealers' Assn. G. A. Wahlgreen, Manager.

March 10-15—Syracuse, N. Y. Syracuse Automobile Dealers' Assn. Harry T. Gardner, Manager.

Second or third week March—St. Louis, Mo. St. Louis Auto Mfrs. & Dealers' Assn. Robert E. Lee, Manager.

March 15-23—Boston, Mass. Boston Automobile Dealers' Assn. Chester I. Campbell, Manager.

March 22-29, Passenger Cars; April 1-5, Trucks—Brooklyn, Brooklyn Motor Vehicle Dealers' Assn. I. C. Kirkham, Manager.

Third week March—Trenton, N. J. Trenton Auto Trade Assn. John L. Brock, Manager.

March—Pittsburgh. Automobile Dealers' Assn. of Pittsburgh. John J. Bell, Manager.

March—Utica, N. Y. Utica Motor Dealers' Assn. W. W. Garabrant, Manager.

Feb. 15-22—Cleveland, Ohio. Cleveland Auto Show Co. Fred H. Caley, Manager.

April 5-12—Montreal, Can.—National Motor Show of Eastern Canada, Victoria Rink. T. C. Kirby, Manager.

Not decided—Bridgeport, Conn. Auspices of City Battalion. B. B. Steiber, Manager.

Not decided—Harrisburg, Pa. Harrisburg Motor Dealers' Assn. J. Clyde Myton, Manager.

Not decided—Hartford, Conn. Hartford Automobile Dealers' Assn.

Not decided—Indianapolis, Ind. Indianapolis Auto Trade Assn. John B. Orman, Manager.

Feb. 10-15—Kansas City, Mo. Kansas City Motor Dealers' Assn. E. E. Peake, Manager.

## TRACTOR SHOWS

Feb. 10-15—Kansas City, Mo. Fourth Annual Tractor Show. Sweeney Building. Kansas City Tractor Club. Guy H. Hall, Sec.

Feb. 18-22—Wichita, Kan. Annual Mid-west Tractor and Thresher Show, Wichita Tractor and Thresher Club. Forum.

## CONVENTIONS

Dec. 30-Jan. 1—Chicago, Ill. Twelfth Annual Meeting American Society of Agricultural Engineers. J. W. Dickinson, Secretary, Ohio State University, Columbus.

Feb. 4-6—New York. Meeting. Society Automotive Engineers.

Feb. 25-28—New York. Sixteenth Annual Convention. American Road Builders' Assn.

## Cultivating the Chinese Automotive Field

(Continued from page 1107)

equal number of persons at any other place in the world. Then there are the Chinese, the number of whom able to buy motor cars it would be impossible to estimate. Very often you will find that a Chinese family operating one car will quickly add several more to its fleet.

Naturally in such a market there will be a variety of ideas as to the car which will definitely meet individual needs, and the methods of choosing will, of course, differ. Among the Europeans, for instance, we find that the buyer has a natural inclination to purchase a motor vehicle made in his own country, and he will usually do so, if he can secure a car that comes within his purse. The foreigner, too, before investing will make a close study of the mechanical construction of the machine and buy largely on his personal knowledge of construction, on the word of friends owning cars of the same make, or the service which the dealer can give him. The Chinese buyer, on the other hand, in nine cases out of ten pays absolutely no attention to mechanical construction. He buys because he likes the appearance of the car, its color, and number of accessories. He is not trained in mechanics and shows no interest in them.

The lower-priced American cars have established themselves in every selling center of China and are now taking the bulk of the trade, but that there is a demand for higher-priced cars is borne out

by the fact that a great number of European cars are operated in the larger cities. Manifestly, therefore, there is no reason why any American manufacturer cannot go after business in China with his standard car, but if his domestic product is built with left-side drive, he must furnish his cars for this territory with a steering column on the right, and magneto is preferred to battery ignition.

## Want Detroit-Cleveland Air Mail

WASHINGTON, Dec. 23—The Post Office authorities here have been requested by the Detroit Post Office to establish airplane mail service between Detroit and Cleveland. The request will be acted upon later.

## Fuel Oil Priorities Abolished

WASHINGTON, Dec. 21—All priorities in respect to fuel oil and gas oil were abolished in an order issued to-day by the United States Fuel Administration, in line with its general policy of removing all wartime restrictions as rapidly as conditions warrant.

In to-day's order, Rule 1 of an order issued Sept. 24, 1918, establishing priorities for the entire country in respect to the delivery of fuel oil and gas oil, creating 12 classes, and providing for the serving of the needs of consumers in the order named, is completely set aside. All consumers are now on an equal basis.

## Hair-Line Defects in Crankshafts

(Continued from page 1105)

about 80,000 lb. per sq. in., the ultimate strength about 120,000 lb. per sq. in., the elongation about 15 per cent, and the reduction in area about 38 per cent.

(4) The "hair-line" on the surface has no appreciable depth.

(5) The two steels show long threads of manganese sulphide and iron oxide parallel to the direction of forging.

(6) The structure is martensitic but is streaky or laminated parallel to the forging.

(7) This lamination is due to segregation.

(8) It is the primary cause of the fibrous appearance of the fractures.

(9) The presence of the threads of manganese sulphide and iron oxide tend to make the fibrous fracture more pronounced.

## "Pirate" Part Suit Brought by Connecticut Company Settled

NEW YORK, Dec. 21—The suit in equity instituted by the Connecticut Telephone & Electric Co., Meriden, against Paul G. Niehoff & Co. alleging infringement of certain Connecticut parts through the sale of spare parts not made by Connecticut but sold for Connecticut equipment, has been settled out of court. Niehoff recognizes the validity of the Connecticut patents and has agreed not to sell "pirate" parts.

# Automotive Chronology for 1918

Important Developments in the Industrial and Financial  
Fields Arranged According to Date of Occurrence

## January

- 2—Three samples of Class A standardized war trucks manufactured in White, Denby and Autocar factories arrive in Washington, after drive from factories.
- 2—Secretary McAdoo as Director of Railroads issues order that any consignee who does not promptly unload freight cars and release them for return trips, must be embargoed.
- 2—J. C. Wilson Co. and Dodge Brothers announce that drive-away policy for trucks is satisfactory, and will be followed by them throughout the winter.
- 2—General Motors Corp. announces undivided profits of \$12,900,000 for 4 months ended Nov. 30, 1917.
- 2—Post Office Department plans to establish from 3000-4000 miles of motor truck parcels post routes to be in operation before April 1.
- 5—First War Automotive Show opens at Grand Central Palace, New York.
- 8—Second truck train of 46 Pierce-Arrows ends trip from Buffalo to Governor's Island.
- 8—Exports drop 10 per cent in November.
- 9—S. A. E. announces the addition of 1000 new members in 1917.
- 10—Thirteenth annual session of S. A. E. C. F. Kettering elected president.
- 14—Eighteen Lansing firms allied for war work.
- 14—Overland profits in 1917 \$8,500,000.
- 14—New York Rotary Motor Co. places new 3-wheel delivery car on market.
- 15—Petroleum output for 1917 breaks record. Supply is 341,800,000 bbl., or 14 per cent more than in 1916.
- 16—Proclamation issued by Fuel Administrator ordering shut-down of industry for five days from Jan. 18-22, and 10 Mondays from Jan. 21 to March 25.
- 18—Committee of three receivers named for Bijur Motor Lighting Co.
- 21—Canada registrations for 1917 show 199,301 cars and trucks. Great increase in trade and capital also recorded.
- 22—New altitude record made by Lieut. Brak-Papa in SIA biplane with FIAT engine.
- 22—Rubber Assn. of America appoints a war committee to act as a point of contact between the industry and government. B. G. Work named as chairman.
- 22—Collier Motor Truck Co. starts production on new  $\frac{3}{4}$ -ton model.
- 23—Reports from England show that of 490,000 cars and trucks in Great Britain approximately 80 per cent are out of commission, due to lack of fuel.
- 24—After 5-day shut-down, manufacturers find that the fuel situation is not greatly improved.
- 24—Mexico rated as second largest oil-producing country, replacing Russia.
- 26—National Assn. of Boat and Engine Manufacturers urge adoption of standard motor lifeboat as part of the equipment of the emergency fleet.
- 28—Only 124 Michigan plants, all doing government work, are exempted from the Garfield closing order.
- 28—Goodyear Tire & Rubber Co. inaugurates plan of selling \$25,000,000 second preferred stock to service station dealers and their customers. Dealers to receive \$2 per share for selling stock.
- 29—Fuel Administrator Garfield tells meeting of automobile men that he has no intention of curtailing the industry.
- 29—Federal investigations show that the average cost of producing a gallon of gasoline is only 14.9 cents exclusive of freight and sales charges.
- 30—Massachusetts, Pennsylvania, and New York plan the establishment of central bureaus, at which truck drivers will be assigned loads to deliver on their return.
- 3—Detroit tied up by shortage of gas. Between 8000 and 10,000 men laid off temporarily. Conditions acute.
- 5—Duesenberg buys Fiat Poughkeepsie plant. Fiat to occupy part of buildings and production of Fiat cars to go on much as usual.
- 5—Government orders that all fuel oil manufacturers and distributors need Federal licenses if they have gross sales of more than 100,000 bbl. a year. Priority of deliveries given out. Transportation difficulties, not an oil shortage, the cause of the ruling.
- 5—B. F. Goodrich Co. reports net profits of \$12,675,000 for 1917; 33 per cent gain over 1916.
- 5—Ford Motor Co. receives government order for the manufacture of one submarine chaser a day.
- 5—N. A. C. C. appoints a truck committee to help the government break up the freight congestion. George M. Graham, chairman.
- 9—Twin Cities stage first automotive show. Unprecedented crowds attend. Tractors the best card.
- 9—The keel of the first of the submarine chasers being built by the Ford Motor Co. is laid.
- 11—National Motor Transport Co. plans a motor freight line between Detroit, Cincinnati, Cleveland, Toledo and Chicago to alleviate railroad congestion.
- 12—Ford Motor Co. starts production of complete Liberty engines. Will be largest single producer.
- 12—Post office department asks for bids for an airplane mail service, with a round trip daily between New York and Washington.
- 12—Master Truck Transportation Co. plans operation of a motor freight line on schedule time, between Chicago and New York.
- 12—Edward R. Stettinius given powers to push all war work and maintain an even flow of production. To be surveyor of industrial field and accelerator of war supplies.
- 13—Essex car announced by Hudson.
- 16—President Wilson issues proclamation regulating exports and imports. Special licenses needed for many products.
- 18—Buda Co. exhibits new model tractor engine at Kansas City Show.
- 19—Establishment of Return Load Bureaus in Connecticut of great value.
- 20—Chandler Motor Car Co. reports earnings of \$2,382,403 for 1917.
- 21—First Liberty plane shipped to Europe.
- 23—Chevrolet company assumes status as a division of General Motors Co.
- 23—American delegation, headed by F. G. Diffin, reported safe in England to confer on adoption of international standards for manufacturing materials related to cars, trucks, tractors and machinery.
- 25—Ford shipbuilding plant on River Rouge for the manufacture of submarine destroyers.
- 25—Roads so improved that drive-away can be resumed in Michigan.
- 25—Price of Ford car increased \$90, and chassis to cost \$75 more.
- 26—Bernard Baruch made head of War Industries Board, succeeding Daniel Willard.
- 26—Fisk Rubber Co. announces profits of \$3,578,484 for 1917, double the amount of 1916.
- 26—Announcement made that S. A. E. summer session will be held in Dayton, June 17 and 18.
- 27—Ohio War Industries Commission gives out plan whereby all Ohio factories will be co-ordinated for war work.
- 27—The State of Pennsylvania buys 40 tractors to put at the disposal of farmers.

## March

- 2—Kelly-Springfield Tire Co. reports earnings of \$4,323,955 for 1917, equal to 49 per cent on common.
- 2—Embargo placed on handling of motor cars by the railroads modified. Permits obtainable for shipments in certain areas.

- 2—United States Chamber of Commerce urges adoption of Return Load Bureaus throughout the country.
- 4—Trucks end railroad congestion in Hartford, Conn., by unloading freight cars.
- 4—Highway Transport Committee works out plan for rural express service from farms to cities.
- 5—Third annual Salesmanship Congress called in Detroit for April 24-27.
- 6—Washington statistics show drop of 20 per cent in January exports of cars, trucks and parts from the United States.
- 6—Illuminating Engineers and S. A. E. hold tests for determining headlamp glare, as well as maximum and minimum light.
- 6—General Motors reports earnings of \$26,285,951 for 1917, equal to 34.2 per cent on common.
- 6—N. A. C. C. withdraws from Automobile Industries Committee and Hugh Chalmers resigns.
- 7—N. A. C. C. comes to agreement with Fuel Committee and War Industries Board as to passenger car production for 1918. Manufacturers agree to curtail 30 per cent.
- 7—England revises gas restrictions, allowing cars and trucks to receive certain amounts.
- 8—N. A. C. C. organizes truck division so as to give commercial vehicles more attention.
- 9—A. A. A. resumes control of racing in the United States. Contest board takes hold and status will be same as last November.
- 10—France adds 10 per cent tax to motor cars, putting them in the luxury class.
- 11—Ford announces that he will manufacture light tanks for the government.
- 11—Flint factories work out a scheme for pooling their welfare interests in co-operation with the local Y. M. C. A.
- 11—Curtailed schedule of production serves to clarify industry by allowing factories to make definite distribution plans.
- 11—The State of Michigan buys 1000 tractors for distribution among farmers, under certain restrictions.
- 12—Studebaker profits for 1917 show decrease of 60 per cent.
- 12—Peerless Truck & Motor Corp. profits for 1917 are \$1,065,869, equal to 10.6 per cent on common.
- 14—Motor Products Corp. reports earnings of \$537,527 for first year.
- 14—Committee appointed to investigate airplane situation. H. Snowden Marshall made chairman.
- 15—National Conference of Tractor Manufacturers formed in Chicago.
- 18—Three airplane investigations started.
- 20—J. I. Case Co. announces profits equal to a share on common for 1917—double the 1916 amount.
- 20—Steel trade denies any shortage of steel which may make further curtailment of automobile industry necessary.
- 20—M. A. M. A. Washington office considerably enlarged. Will be distinct from N. A. C. C.
- 20—Stromberg Motor Devices Co. reports net profits for 1917 equal to \$6.37 a share.
- 20—Committee appointed to fix prices of basic materials, under the authority of the War Industries Board.
- 22—List of 82 imports, including cars, asbestos, graphite, acids, nickel and zinc, restricted by War Trade Board.
- 25—Gray & Davis, Inc., which went into the hands of a receiver in November, 1916, pays all its debts.
- 26—Price of \$875 for Fordson tractor, with plow, fixed by Michigan War Preparedness Board after consultation with Ford representatives.
- 26—Airplane delay rumors found to be greatly exaggerated, Washington learns.
- 29—The first Liberty truck convoy arrives in Baltimore after trip from Lima, Ohio. There were 20 trucks and 3 passenger cars in the train.
- 30—Oil Administrator Requa says that there is plenty of gasoline on hand, and the only possible shortage may arise from transportation difficulty, not from production decrease.

## February

- 2—Chicago Show closes. 150,000 attend. Interest of farmers deemed significant.
- 2—Chevrolet reports sales of \$62,638,303 for 1917. Gain of 32 per cent over 1916.

## April

- 1—International Motor Truck Corp. reports earnings of \$1,127,093 for 1917. Assets increase 50 per cent.
- 2—White Co. reports earnings of \$3,800,308, approximately the same as for 1916.
- 2—Pierce-Arrow company earns \$11 a share for 1917. Gross business increases 75 per cent over 1916.
- 2—Overland profits for 1917 are \$3.16 a share. Net profits less than those of 1916.
- 2—Liberty engine commended by Marshall airplane report. Government red tape blamed for production delays.
- 2—Cars are taxed 10 per cent in France, thereby being placed in luxury class.
- 8—Requirements Division formed to direct and co-ordinate purchases of Government.
- 8—Parrett Tractor Co. reorganized with a capital of \$3,000,000. Claire Barnes and Vincent Bendix interested in new company.
- 10—War Industries Board places aircraft at head of new priority list for fuel supply.
- 10—Ford two-man tank able to carry 1200 lb. of armor makes its first appearance.
- 10—J. D. Maxwell joins Automotive Products Section to work with H. L. Horning.
- 17—Truck, motorcycle and car buying coordinated, by order of Chief of General Staff, which places Quartermaster officials at head of board.
- 18—New England Highways Return Loads Assn. formed to link all of New England.
- 19—Colonel George Pope, treasurer of N. A. C. C., dies.
- 20—M. A. M. A. appoints a war service committee to serve as a point of contact between association and Government.
- 23—After an investigation showing they were enemy-owned the Bosch plants were taken over by the Government.
- 24—Practically all tire companies increase their prices 10 per cent.

## May

- 1—War Corporation with capital of \$500,000, formed by Government to aid in financing war industries.
- 2—Rubber imports cut 37½ per cent by an order of the War Trade Board.
- 7—Court decides that the vacuum tank principle was not infringed by the Thermo-Vacuum system. Stewart-Warner to appeal.
- 8—Curtiss earnings for 1917 figured at \$2,000,000 after deduction of preferred dividends.
- 11—Export licenses restricted by War Trade Board. Exports to Allies must be approved by War Mission before license is granted.
- 13—Manufacturers agree with Government that war needs demand 100 per cent priority on steel and other material needed for war products. No specified curtailment decided on for this reason.
- 13—Manufacturers, through N. A. C. C., accept action of War Service Committee advising schedule of 9 standard tire sizes.
- 13—New York passes lamp law providing that state may test anti-glare devices and approve them.
- 13—Inventions Section created as part of the General Staff of the War Department to investigate inventions submitted to it.
- 14—Archer A. Landon appointed head of the Division of Production of the Aircraft Board, which is now headed by John D. Ryan.
- 15—Henry Ford & Son decide to standardize Fordson tractor equipment, but will not market this directly.
- 15—Airplane mail service New York to Washington inaugurated.
- 15—Manufacture and importation of all farm equipment must be licensed after June 20, 1918, as a means of conservation. Order passed by Congress and approved by President.
- 15—General Electric purchases control of Bijur Motor Lighting Co. for \$500,000.
- 20—Major F. Glover promoted to colonelcy and placed in charge of Motor Transport Service.
- 21—Felix Frankfurter, assistant to Secretary of Labor, placed in charge of executive part of Labor Administration to prevent competition for workers and aid in labor recruiting work.
- 23—Class A, AA and B trucks tested by War Department.
- 23—H. L. Horning resigns from Automotive Products Section.
- 23—Aircraft Board reorganized by President Wilson. John D. Ryan made head of the Bureau of Aircraft Production. Major-General William L. Kenly made head of Bureau of Military Aeronautics.
- 25—Eight thousand Class B trucks ordered by Motor Transport Service.

28—Christian Girl resigns as director of production of the Motor Transport Section. Rejoins Standard Parts Co.

## June

- 1—Ralph De Palma wins Harkness trophy race at Sheepshead Bay.
- 3—Five-ton standardized tractor demonstrated successfully in Washington.
- 5—Canada puts automobiles costing more than \$1,200 in the luxury class and prohibits their importation.
- 7—Profits of Willys-Overland, Inc., estimated between \$7,000,000 and \$8,000,000.
- 8—Three-ton B truck officially adopted for heavy duty hauling by War Department.
- 8—National Advisory Committee on Aeronautics report praises Liberty engine.
- 11—U. S. Highways Committee formed to co-operate with states for better roads.
- 11—No sweeping curtailment of steel for automobiles, according to agreement between War Industries Board and American Iron and Steel Institute.
- 17—Ordnance Department names managers of districts who will have charge of production under General C. C. Williams.
- 17—Maxim Munitions arranges with Darr for distribution of Maxim-Dart vehicles in East.
- 17—Overland decides on program of war economy. Number of models limited to two or three.
- 17—Steel temporarily withheld from non-war industries.
- 18—S. A. E. holds summer meeting at Dayton, Ohio.
- 18—C. C. Hanch made chief of Automotive Products Section to succeed Harry L. Horning.
- 19—G. M. C. forms coalition with Janesville Machine Co. and plans to enter the tractor field extensively.
- 19—Net earnings of the Fisher Body Corp. for fiscal year ended April 30, 1918, amount to \$4,352,078.
- 19—Export restrictions modified to permit automobiles to be shipped to European neutrals and South American countries.
- 22—War Industries Board and American Iron and Steel Institute raise price of iron 45 cents a gross ton, making price \$5.50.
- 25—Motor Transport Service reorganized under Colonel Glover.
- 26—Vesper and committee of N. A. D. A. appear before Ways and Means Committee to present need for equitable car taxation.
- 26—Chevrolet victor in Chicago Derby, breaking De Palma's 1916 record.
- 27—England contracts for entire output of Australian zinc for the period of the war and 10 years after.

## July

- 1—War Industries Board completes program of eliminating all but nine tire sizes.
- 2—M. A. M. A. plans to close Washington office and permit the work to be continued by War Service Committee in charge of A. W. Copeland.
- 8—James S. Harlan, Interstate Commerce Commissioner, outlines plan for store door delivery for New York.
- 8—All shipments of articles of non-Canadian origin imported from Canada require individual licenses, according to ruling of War Trade Board.
- 8—Coal for passenger car makers reduced to 25 per cent of 1917-1918 amount. For war work manufacturers will receive a 100 per cent supply.
- 9—Steel shipments to be made without priority certificates, War Industries Board rules. Reclassification of consumers made.
- 10—Tax recommendation of Treasury Department to Ways and Means Committee calls for 10 per cent retail sales tax on passenger cars.
- 10—Consolidated classification, filed before Interstate Commerce Commission, would increase freight rates on passenger cars 100 per cent and reduce truck rates.
- 10—Treasury Department rules that cars exported cannot be taxed 3 per cent.
- 13—War Industries Board orders a reduction of more than 3000 plow types.
- 15—United States Fuel Administration rules that car and parts curtailment need not be in proportion to fuel reduction.
- 16—U. S. Employment Service completes plans for labor recruiting and co-operating with manufacturers to get unskilled men.
- 17—War Industries Board orders inventory of all steel in factories to show quantity on hand. Automobile industry seeks a 60 per cent steel allotment agreement.
- 18—Charles W. Nash made Aircraft Production head under John D. Ryan.
- 20—Motor truck manufacturers place before Priority Committee of War Industries Board statement of essential nature of motor truck. Priorities Board outlines

liberal program and assures reasonable steel supply.

- 22—Army truck substituted for original Class A type. G. M. C. substituted for original AA standard army type. Class B to be continued, and T.T. four-wheel-drive, adopted for heavy work. Seventy-five thousand of four models ordered.
- 25—Bristol type plane abandoned, because it is hard to fly.
- 28—De Palma breaks world records in Chicago race. Wins 20-mile race at rate of 110 m.p.h.
- 30—General Motors forms definite plan to take over United Motors. To exchange stock at rate of 3/10 of share of G. M. common and 1/10 preferred for each share of United Motors.
- 31—Francis E. Stanley, steam car pioneer, killed in automobile accident.

## August

- 1—War Industries Board requests rubber industry to cut production 50 per cent during August and September.
- 6—Manufacturers vote in favor of 50 per cent curtailment of passenger car manufacture.
- 6—Profiteering on farm implements barred by Agriculture Department.
- 9—Priority Board recognizes trucks as utilities and decides curtailment in manufacture should be avoided as far as possible.
- 13—War Industries Board does not receive manufacturers' offer of 50 per cent curtailment of passenger car production. Says no promises can be made regarding supplying of steel, rubber, etc.
- 14—Ford production totals 700,000 cars for year ending July 31.
- 17—De Palma wins five races and breaks four records at Sheepshead Bay race.
- 20—Motor Transport Corps of U. S. Army formed to control all motorized vehicles excepting creeper-type tractors. Brig. Gen. Drake at head.
- 20—Senate Military Affairs Committee in report condemns airplane activities and recommends establishment of Ministry of Aeronautics.
- 26—War Industries Board to allow manufacturers enough steel to produce 50 per cent of amount manufactured during last 6 months of 1917 during corresponding time of 1918. Makers having more than this amount of steel on hand must turn over excess supply.
- 26—Tentative locations for two Ford plants chosen in Mexico, at Monterey and Guadalajara.
- 28—John D. Ryan appointed Second Assistant Secretary of War in charge of all army air activities.
- 28—Fuel Administration requests owners of passenger cars to stop Sunday motoring east of Mississippi.
- 28—Association of Automotive Wheel Manufacturers organized in Toledo.
- 31—Exports of tires, tubes and oil to Norway restricted. Definite guarantee required.

## September

- 1—Gasoline saving on first motorless Sunday figured at 100,000 bbl.
- 5—N. A. C. C. votes to abandon National shows during war.
- 8—New preference list of 74 industries compiled by War Industries Board headed by aircraft.
- 9—N. A. A. J. abandons Chicago show scheduled for Oct. 28.
- 10—Navy airplane base at Balveston planned, to cost \$3,000,000.
- 10—Ford Motor Co. announces that manufacture of passenger cars will be abandoned immediately. Entire plant to be devoted to war work.
- 10—Manufacturers of motor trucks to be permitted to maintain average truck output during last half of 1918.
- 11—Purchase, production and procurement of motorized army vehicles taken from Motor Transport Corps and placed under Quartermaster Department.
- 16—New York State approves anti-glare devices. Names of 45 tested and approved types made public.
- 21—War Industries Board limits quantity of iron and steel for manufacture of tractors and farm implements during year beginning Oct. 1, 1918, to 75 per cent of amount used during preceding year.
- 21—Standard contracts designed for war work to speed up production and guarantee against fraud.
- 25—Willys-Overland obtains control of 51 per cent of stock of Moline Plow Co., latter to be operated as separate concern.
- 25—Motors Division of Quartermaster Corps organized under Colonel Fred Glover.

- 30—War Board reduces solid tire sizes to 14 standardized sizes. Reductions to be made within 2 years.

## October

- 1—Car manufacturers planning to enter truck field affected by government ruling regarding starting of new industries. Paige, Oakland, Overland, Briscoe and Columbia companies affected.
- 3—Air Service Clubs Association organized with Major-General Kenly as president. To promote efficiency of air service.
- 8—Announcement made that Division of Military Aeronautics will discard \$23,000,000 of aircraft parts.
- 9—Ahara carburetor patent upheld when Stromberg wins decision over Zenith.
- 11—Tractor makers form American Tractor Assn. and will protest curtailment case with War Industries Board.
- 15—General Motors' earnings for first 6 months of 1918 on common are 10 1/4 per cent in excess of 12 per cent dividend now being paid.
- 18—Standard specifications for motor and aviation gasoline adopted following conferences between Specifications Committee of the Allies and the American Committee on Standardization of Petroleum Products.
- 18—Navy uses Liberty engine exclusively in seaplanes. Now has 900 planes so equipped in service.
- 19—Gasless Sundays discontinued. Seven of them saved 1,000,000 gal.
- 21—Merger of four Canadian companies arranged—includes McLaughlin Motor Car Co., Chevrolet Motor Co. of Canada, Ltd., McLaughlin Carriage Co., Ltd., and General Motors Co.
- 21—Ford Motor Co. has biggest year in history. Surplus on July 31, 1918, totaled \$176,242,728.
- 24—Packard Motor Car Co. announces surplus of \$13,657,860 on Aug. 31, 1918.
- 24—Fiat Co. of Turin, Italy, develops worm-drive tractor.
- 28—Republic Motor Truck Co. earnings for year ending June 30, 1918, are \$985,084.
- 31—Hughes aircraft report issued. Vindicates manufacturers.
- 31—Wright-Martin earnings during 13 months ending June 30, 1918, were \$540,678.
- 31—War Industries Board permits electrical and ball bearing manufacturers to sell parts for passenger car repairs.
- 31—American Manufacturers Exports Assn. convenes to plan building up of foreign trade.

## November

- 2—Maxwell Motor Car Co. earnings for year ending July 31, 1918, are \$2,158,836. Net surplus reduced.
- 2—Nordyke & Marmon factory wins pennant for best percentage of Liberty engine quota production during October.
- 4—Working Conditions Service established in Washington to construct uniform standards for working conditions in all industries.
- 4—Ford Motor Co. of Canada, Ltd., gross business totals \$24,608,422 during year ending July 31, 1918. Increase of \$800,000 over preceding year.
- 11—Armistice signed by Allied commanders and Hun envoys.
- 12—Tractor curtailment order modified to permit manufacturers having new designs to go ahead with them. Small manufacturers helped.
- 12—Production restrictions imposed by War Industries Board lifted 50 per cent for remainder of year.
- 15—War Industries Board plans co-operation with agencies for cancellation of contracts.
- 19—Ford Motor Co. plans return to peacetime quantity production basis at earliest possible moment. 25,000 cars released to dealers.
- 22—Export and import regulations modified. Provide for importation of 7500 additional tons of rubber.
- 23—New York State investigation of tractors shows they increase crop yields but do not decrease cost of operations.
- 25—General Motors develops Samson 2-plow tractor to sell for \$650 and compete with Fordson.
- 25—Post Office Department plans to use army trucks with discharged enlisted men as drivers for mail service.
- 26—Bureau of Standards tests substitute for gasoline made by Capt. E. C. Weisgerber. Finds it satisfactory.
- 27—John D. Ryan, Second Assistant Secretary of State, in charge of aircraft production, resigns. No time set for relinquishment of duties.
- 29—Export product list revised. All manufactured rubber articles, but not crude rubber, may be shipped.

- 29—Non-stop flight record broken by de Havilland-4 plane with Liberty 12 engine in 550-mile trip from Dayton to Mineola.
- 30—United States Rubber Co. has record earnings of \$21.64 a share on outstanding common during year ending June 30, 1918.

## December

- 1—First aerial weather forecast issued by Weather Bureau in co-operation with aerial mail service.
- 4—Business meeting of 5000 delegates at Atlantic City under auspices of Chamber of Commerce of United States recommends that government should let business set reconstruction pace.
- 5—Reo annual report for year ending Aug. 31, 1918, shows increase of \$1,300,000 in assets over preceding year.
- 7—Highways Transport Committee forms definite program for snow removal during winter. Asks co-operation of states.
- 7—Ford Motor Co. announces that all sedans will be equipped with electric starters hereafter.
- 9—Postmaster General Burleson, in annual report, says that aerial mail, city motor vehicle and parcel-post motor truck systems will be developed amazingly during the coming year.
- 9—Goodyear announces record profits of \$15,388,190 for the year ending Oct. 31, 1918.
- 9—Lieut.-Col. Jesse Vincent, commended by President for services to America, returns to Packard company.
- 9—Annual report of Secretary of War states total appropriations for motor transportation for year ending June 30, 1918, totaled \$883,000,000, of which \$350,000,000 has been expended.
- 10—Post Office Department increases requisition for trucks. Expected that orders with truck manufacturers will not be canceled.
- 11—All curtailments of material and limitations of manufacture of tractors are removed.
- 11—Joint meeting of state highway officials and Highways Industries Assn. proposes 50,000-mile national highway and Federal Highways Commission.
- 13—Announcement made that all passenger cars and standardized trucks now in possession of the Motor Transport Corps in this country will be retained by army.
- 14—War Trade Board announces that practically unlimited export of commodities is now permitted.
- 18—Court decides Goodyear patents are not infringed in suit brought by Goodyear against Firestone.
- 19—Airplane mail service increased 600 per cent during November.
- 19—Substitute for platinum developed.
- 20—Sale of French war worn vehicles brings \$6,000,000.
- 20—Department of Military Aeronautics plans to sell several hundred planes and engines on the open market.
- 20—Appropriations for air service total \$164,877,363 for the army and \$225,000,000 for the navy.
- 20—Dates set for dealers automotive exhibitions in New York and Chicago.
- 21—Annual report of Department Military Aeronautics made public.
- 21—Col. E. A. Deeds presented with engrossed testimonial on behalf of the Equipment Division of the Signal Corps.
- 21—October exports to Latin America show big drop, probably due to transfer of shipping.
- 21—Annual report of the Bureau of Mines issued to-day.
- 23—Four army training planes flying from the Pacific Coast reach the Atlantic Coast.
- 23—Major General C. T. Menoher made Director of Bureau of Aircraft Production. Col. James A. Mar to be his assistant.
- 23—Congressman Dent introduces bill to validate "illegal" contracts and to provide for payments on them.
- 23—United States had 39 aero squadrons on the battle front when the Armistice was signed.
- 23—Export regulations covering South American shipments revised.
- 24—England partly removes restrictions on use of private cars.
- 24—N.A.C.C. opposes what it terms discriminatory taxation of the automobile industry.

Changes of Capital  
and Refinancing

- Acason Motor Truck Co., Detroit. \$50,000—\$200,000.
- Acme Motor Truck Co., Detroit. \$280,000—\$1,000,000.
- American Machine Products Co., Detroit. \$10,000—\$40,000.
- American Steel Tube Co., Toledo. \$50,000—\$100,000.
- Auto Indicator Co., Grand Rapids. \$15,000—\$50,000.
- Clum Mfg. Co., Milwaukee. \$10,000—\$100,000.
- Columbus Varnish Co., Columbus, O. Increase to \$400,000.
- Comet Automobile Co., Decatur, Ill. \$1,000,000—\$3,000,000.
- Continental Auto Parts Co., Knightstown, Ind. \$10,000—\$50,000.
- Curtis Tire & Rubber Co., Chicago. (Old style) Vulcanized Products Co. Increase to \$1,000,000.
- Cygnat Mfg. Co., Buffalo. (Reorganization of Cygnat Rear Car Co.) Capital \$400,000.
- Defender Auto Lock Co., Detroit. \$2,500—\$25,000.
- Dellon Tire & Rubber Co., Trenton. \$700,000—\$1,000,000.
- Denas Armor-Cased Tire Saving Co., Pittsburgh. \$200,000—\$1,000,000.
- Dietrich Motor Car Co., Youngstown, Ohio. \$15,000—\$25,000.
- Dort Motor Car Co. \$1,500,000—\$2,000,000.
- Erd Motor Co., Saginaw. \$100,000—\$250,000.
- Falls Rubber Co., Akron. \$500,000—\$1,000,000.
- Ford & Son, Detroit. \$1,000,000—\$5,000,000.
- Four Wheel Drive Automobile Co., Clintonville, Wis. \$1,000,000—\$2,000,000.
- Fruehauf Trailer Co., Detroit. \$100,000—\$150,000.
- Gary Motor Truck Co., Gary, Ind. \$125,000—\$175,000.
- General Motors Corp. Pfd. \$50,000,000—\$100,000,000. Com. \$150,000,000—\$200,000,000.
- Genesee Motor Car Co., Utica, N. Y. \$5,000—\$100,000.
- B. F. Goodrich Co., Akron. Reduced from \$86,400,000 to \$85,500,000.
- Goodyear Tire & Rubber Co., Akron. \$50,000,000—\$100,000,000.
- Gray & Davis, Inc. Stock increased \$113,000.
- Gray Motor Co., Wilmington, Del. \$550,000—\$1,000,000.
- Holt Mfg. Co., Stockton, Cal. Increase of \$898,000.
- Hurlburt Motor Truck Co., New York. Increase of \$500,000.
- Hydraulic Pressed Steel Co., Cleveland. \$5,700,000—\$7,200,000.
- Industrial Controller Co., Milwaukee. \$100,000—\$150,000.
- Jones Motor Car Co., Wichita. \$500,000—\$1,500,000.
- Jordan Motor Car Co., Cleveland. \$300,000—\$500,000.
- Kelly-Springfield Tire Co. Reduction of \$248,900.
- Kerosene Equipment Co., Detroit. (Kerosene Carburetor Co.) New capital \$50,000.
- King Motor Car Co., Detroit. \$200,000—\$700,000.
- La Crosse Tractor Co., La Crosse. \$1,500,000—\$2,500,000.
- Lane Motor Truck Co., Kalamazoo. \$25,000—\$225,000.
- Lansing Forge Co., Lansing. \$100,000—\$300,000.
- Liaison, John. Mfg. Co., New Holstein, Wis. \$500,000—\$1,000,000.
- Mather Spring Co., Toledo. \$300,000—\$1,000,000.
- Mohawk Rubber Co., Akron, Ohio. 1,050,000—\$2,050,000.
- Napoleon Motors Co., Traverse City, Mich., formerly Traverse City Motor Car Co. \$150,000—\$500,000.
- Newark Stamping & Foundry Co., Newark, Ohio. \$50,000—\$75,000.
- Noble Motor Truck Corp., Kendallville, Ind. \$1,000,000. (Reorganization of Noble Motor Truck Co.)
- Ohio Happy Farmer Tractor Co., Bucyrus, Ohio. \$20,000—\$40,000.
- Ohio Rubber Co., Cleveland. \$100,000—\$500,000.
- Onelda Motor Truck Co., Green Bay. \$300,000—\$500,000.
- Peoria Tractor Co., Peoria. \$60,000—\$1,500,000.
- Perfex Radiator Co., Racine. \$15,000—\$1,000,000.
- Ohio Rubber Co., Cleveland. \$400,000—\$500,000.
- Saginaw Malleable Iron Co., Saginaw, Mich. \$400,000—\$650,000.
- Sanford Motor Truck Co., Syracuse. \$50,000—\$250,000.
- Seaman Co., W. S., Milwaukee. \$50,000—\$150,000.
- Sloux City Tire Mfg. Co., Sloux City. \$20,000—\$1,500,000.

Smith Wheel Co., Inc., Syracuse. \$1,000,000—\$3,000,000.  
Tower Motor Truck Co., Greenville. \$100,000—\$200,000.  
Triangle Truck Co., St. Johns. \$50,000—\$100,000.  
Turner Mfg. Co., Port Washington, Wis. \$150,000—\$250,000.  
Universal Motor Co., Oshkosh. \$50,000—\$100,000.  
Victor Screw Works, Detroit. \$250,000—\$500,000.  
Weidely Motors Co., Indianapolis. Preferred stock \$100,000—\$500,000.  
Wisconsin Motor Mfg. Co., Milwaukee. Increase to \$1,000,000.

## New Companies

Abbott-Downing Truck & Body Corp., Concord, N. H. (To absorb Abbott & Downing Co.) Concord trucks. March.  
Acme Motor Parts Co., Milwaukee. Parts. \$25,000. June.  
Aeronautical Engine Co., Long Island City. Feb.  
American Motors Co., Milwaukee. \$1,000,000. Internal Oil combustion engines. Jan.  
American Tire Filler Co., Seattle. \$100,000. Composition fillers for tires. April.  
American Tractor Corp., Richmond, Va. \$1,000,000. Traction engines. Jan.  
American Veneer Co., Hayward, Wis. Airplane veneers, propeller materials, gun stocks, etc. \$100,000. Oct.  
Andis Tool Co., Racine. Tools, dies, jigs, etc. \$25,000. Sept.  
Automotive Mfg. Co., Detroit. \$125,000. Parts. April.  
B. & H. Machine Products Co., Detroit. Airplane and truck engine parts. Oct.  
Badger Chemical Co., Stanley, Wis. \$500,000. Wood alcohol. Feb.  
Baker Automobile Top Co., Columbus, Ohio. Tops. Feb.  
Blumberg Mfg. Co., San Antonio, Tex. Farm tractors. July.

World Harvester Corp., New York. \$1,500,000. Auto-Filler. Jan.  
Zelle Tractor Co., St. Louis. \$1,000,000. Jan.

## Demand for Labor in Excess of Supply

WASHINGTON, Dec. 21—The demands for labor is in excess of supply, according to reports received by the U. S. Employment Service from its Community Labor Boards in 34 States. For the week ended Dec. 6, reports from 6000 employers using more than 3,000,000 workers in 109 manufacturing districts showed the Eastern States, with the exception of the Buffalo district, suffering from labor shortage. Buffalo has a surplus of workers due to the recent discharge of airplane employes, and has within its boundaries 6000 men who are temporarily idle. Reports from 87 concerns in Detroit, employing 150,000 men, show the supply just equal to the demand. Pennsylvania districts and the New England States report heavy shortages. The Middle West reports supply just equal to demand, but heavy increases in labor requirements are expected at Chicago during the next few weeks. These are likely to cause a shortage

there, which in turn may be offset by the anticipated discharge of workers in the St. Louis district, where there have been many plants engaged on war work.

The situation in the Far West is reported generally good, with the exception of California. Los Angeles reports a seasonal labor shortage and Oakland records a surplus. Shortages of labor are generally reported from the South.

## New Radio Telephone Tested

WASHINGTON, Dec. 21—An airplane formation of three planes directed by a fourth by means of the new radio telephone was staged here yesterday in an exhibit for the benefit of Government officials. Lieut. P. D. Lucas, guiding a Curtiss plane, talking through the radio phone in an ordinary conversational tone, directed the flight of the other planes a mile away, all four flying at 2000 ft. The 3 planes went through infantry drill side slips, tail spins and other maneuvers as directed. Communication by phone was also maintained with Bolling Field, where phones were installed and through which Lieut. Lucas' commands could be distinctly heard.

## Detailed Statements of Contractors' Claims to Be Filed

WASHINGTON, Dec. 21—The Department of Finance and Accounting of the War Department has prepared a form for filing detailed statements of claims by contractors holding cancelled orders. They are arranged to secure information of:

- Number of parts or articles.
- Name.
- Quantity.
- Kind of materials.
- Weight per pc. rough.
- Weight material on hand (raw, semi-finished, finished).
- Original material value (raw, semi-finished, finished).
- Less salvage value (raw, semi-finished, finished).
- Net material claim (raw, semi-finished, finished).
- Accrued labor.
- Accrued overhead.
- Total claim.
- Is salvage value based on scrap or commercial utilization?

## To Distribute Government Property

WASHINGTON, Dec. 21—P. W. Hare, assistant director of Munitions, and Brig. Gen. T. C. Jamieson, Munitions Bldg. 19th and B Sts., Washington, have been appointed in charge of an organization to dispose of all surplus property acquired by the War Department during the war and including airplanes, airplane engines, accessories, motor trucks, motorcycles and other commodities. It is the intention of this department to so market government property as to interfere as little as possible with business conditions and they will confer when the occasion requires or upon request, with committees representing the industries affected.

## S. A. Export Rules Are Revised

### Shippers Must Give Evidence of Preference When It Is Applied for

WASHINGTON, Dec. 23—In order to make shipments for export to the East Coast of South America and secure preference for these, the shipper's export declaration should bear evidence of the preference to which the shipment is entitled. The declaration, if made for shipment to Argentina, Brazil, Paraguay or Uruguay, must bear the export license number, date of expiration, date of issuance of the license and number of the shipping preference.

Upon presentation of the declaration containing information as outlined in the paragraph above, collectors of customs will not only number and initial the declaration as heretofore, but will also initial the date of issuance of the license and the preference number, if any specific preference number has been given on the license.

In instances where licenses and declarations have already been filed with a collector of customs, and where the copies of the export declaration do not bear the date of issuance or expiration of the license, the shipper may, in order to secure the shipping preference to which his shipment is entitled, present such export declaration, or number thereof, to the collector of customs, who will certify the date of issuance of the license (or the date of expiry). Alternatively, the War Trade Board, either at Washington, D. C., or at any of its branch offices, will, upon presentation of the license number, give a certificate to the shipper, indicating the date of issuance of the license.

Steamship companies have been informed that where the expiration date of the license is given on the export declaration, the date of issuance of such license shall be considered as 90 days prior to the date of expiry.

### Cablings of Import License Numbers No Longer Required

WASHINGTON, Dec. 23—American consuls in foreign countries have been instructed to certify invoices without official notification from the War Trade Board upon production of a letter or cablegram from the consignee giving the import license number, commodity and quantity thereby licensed. All official notifications of license numbers cabled or mailed to consuls by the War Trade Board are still effective, and consuls will continue to certify invoices thereunder. Individual notices will be sent to all importers who have applications for licenses pending before the Bureau of Imports, where official notice to the consul is not sent by the Board due to the present ruling.

Shipping companies will be required to return at their own expense all shipments not covered by consular invoices, where

invoices are required under the State Department's regulations.

The present announcement is a part of the War Trade Board's program to remove as rapidly as possible all regulations which the changed conditions brought about by the armistice have rendered unnecessary. The official cabling system has been continued up to the present time in order to protect importers who obey the regulations, by preventing others from violating them. It is now felt that the relaxation of import restrictions has reached a point where this can be done away with, and that importers who are co-operating with the War Trade Board by complying with regulations may be protected by other means.

### Sales Tax Paid by Manufacturers

WASHINGTON, Dec. 20—The total of \$23,981,268.35 collected on the 3 per cent sales tax on automobiles, motorcycles, etc., in the fiscal year ended June 30, 1918, although chiefly derived from Michigan, also included payments of \$3,152,132.17 from Ohio, \$1,890,511.79 from New York, and \$1,236,679.88 from Wisconsin, and lesser but important amounts from many other states as follows:

States and Territories	Automobiles, Motorcycles, Etc., 3 Per Cent
Alabama	.....
Alaska	.....
Arizona	.....
Arkansas	.....
California	.....
Colorado	.....
Connecticut	.....
Delaware	.....
District of Columbia	.....
Florida	.....
Georgia	.....
Hawaii	.....
Idaho	.....
Illinois	.....
Indiana	.....
Iowa	.....
Kansas	.....
Kentucky	.....
Louisiana	.....
Maine	.....
Maryland	.....
Massachusetts	.....
Michigan	.....
Minnesota	.....
Mississippi	.....
Missouri	.....
Montana	.....
Nebraska	.....
Nevada	.....
New Hampshire	.....
New Jersey	.....
New Mexico	.....
New York	.....
North Carolina	.....
North Dakota	.....
Ohio	.....
Oklahoma	.....
Oregon	.....
Pennsylvania	.....
Rhode Island	.....
South Carolina	.....
South Dakota	.....
Tennessee	.....
Texas	.....
Utah	.....
Vermont	.....
Virginia	.....
Washington	.....
West Virginia	.....
Wisconsin	.....
Wyoming	.....
Total	\$23,981,268.35

The floor tax as filed in the report of the Commissioner of Internal Revenue does not list separately the various industries upon which it was levied and which includes automobiles, cameras, playing cards, cosmetics, medicinal preparations, sporting goods, etc. The total for these preparations is \$3,022,183.36.

## Specifications for Government Oil

### Requirements for Motor, Trans- mission and Slushing Oil and Greases

WASHINGTON, Dec. 23—Following are Government specifications for various oils and greases used by the different departments:

#### CYLINDER OIL

##### 1. General:

(a) This specification covers the requirements of the Ordnance Department for motor oil to be used for the lubrication of internal combustion engines other than airplane engines and motorcycle engines. (For these engines, War Department specification number 3501, "Liberty Aero Oil," dated January 14, 1918, shall be used.)

(b) The oil shall be supplied in three grades, light, medium and heavy. The light oil shall be used where specially specified. The medium oil shall be for general use in winter and for use in new engines at all times. The heavy oil shall be for general use in summer and for use in old engines.

##### 2. Physical Properties and Tests:

(a) The oil must be a refined and filtered mineral oil, or a mixture of such oils. It must be suitable in every way for the satisfactory lubrication of the internal combustion engines specified above.

(b) The viscosity of the three grades of oil, when tested in a Saybolt Universal Viscosimeter at 100 deg. Fahr., must be within the following limits:

Light oil	.....170 to 230 sec.
Medium oil	.....270 to 330 sec.
Heavy oil	.....470 to 530 sec.

(c) The carbon residue determined by the Conradson method must be as follows:

Light oil	.....not more than 0.2 per cent
Medium oil	.....not more than 0.4 per cent
Heavy oil	.....not more than 0.6 per cent

(d) One ounce of the oil must not congeal in a standard four-ounce sample bottle when exposed to the following temperatures:

Light oil	.....25 deg. Fahr.
Medium oil	.....30 deg. Fahr.
Heavy oil	.....40 deg. Fahr.

(e) All tests shall be made in accordance with methods adopted by the American Society for Testing Materials, and War Department specification number 3525, "Pour Test and Conradson Carbon Test," dated February 8, 1918, a copy of which will be furnished on application.

#### TRANSMISSION OIL

##### General.

1. This specification covers the requirements of the Army for a very adhesive mineral oil, which must be suitable in every way for the lubrication of transmission gears and bearings, differential gears, worm drives, winch drives and roller and ball bearings used in connection with such parts of the equipment of motor vehicles.

##### Characteristics.

2. The lubricant must be a petroleum product only, without the addition of vegetable or animal oils or products, or residues or fats of any kind. It must be entirely free from fillers such as talc, resin, tar and all materials of every nature not related to the original product.

##### Physical Properties.

3. Viscosity.—The viscosity must be within the following limits, when the lubricant is tested in a Saybolt Universal Viscosimeter at 212 deg. Fahr.: 195 seconds to 220 seconds.

4. Adhesiveness.—The adhesiveness of the lubricant is one of the most essential qualities. As there is no satisfactory laboratory method for its determination, the adhesiveness will be determined by applying the lubricant to a set of gears operating under practical conditions, and comparing the effect produced by the lubricant with the effect produced by a standard sample of Army specifications, No. 10 under the same conditions.

#### NON-FLUID OIL

##### General.

1. This specification covers the requirements of the Army for purchases of non-fluid transmission lubricant to be used for the axles and transmissions of motor vehicles.

##### Physical Properties and Tests.

2. The lubricant shall be composed of cal-

clum soap and mineral oil, manufactured in accordance with the best commercial process. It must have a consistency similar to that known to the trade as "No. 00 Grease."

3. The lubricant must be a boiled grease, containing not less than 1 nor more than 1½ per cent of moisture in the finished product.

4. **Mineral Oil Base.**—The mineral oil used in reducing the soaps, when tested in a Saybolt Universal Viscosimeter at 100 deg. Fahr., must show a viscosity of not less than 180 seconds.

5. **Saponifiable Fat Base.**—Not more than 10 per cent of either pure tallow oil, neat-foot oil, lard oil or horse oil, singly or in combination, shall be used as a fat base.

6. **Acidity.**—The lubricant must not attack a sheet of polished copper within a period of 48 hours.

7. **Heat Test.**—Two ounces of the grease shall be heated to 212 deg. Fahr., or until the entire mass becomes liquid, and then allowed to cool. The soaps must not separate from the oils during this test and the grease must return to its original consistency.

8. **Fillers.**—The grease shall contain no fillers, such as resin, resinous oils, soapstone, wax, talc, powdered mica, lampblack, sulphur, clay, asbestos or any other artificial thickening.

#### MEDIUM CUP GREASE

##### General.

1. This specification covers the requirements of the Army for a medium cup grease to be used for the lubrication of such parts of motor equipment and other machinery as are lubricated by means of compression cups.

2. The grease must be a well manufactured product, composed of calcium soap and mineral oil.

##### Physical Properties and Tests.

3. **Mineral Oil Base.**—The mineral oil used in reducing the soaps must show a viscosity of at least 180 seconds, when tested in Saybolt Universal Viscosimeter, at 100 deg. Fahr.

4. **Saponifiable Fat Base.**—The grease must have a fat base of 15 to 20 per cent, of either pure tallow oil, neat-foot oil, lard oil or horse oil, used singly or in combination.

5. **Consistency.**—The grease must be a medium cup grease similar in consistency to that known to the trade as "No. 3 Cup Grease."

6. **Moisture.**—The grease must be a boiled grease, containing not less than 1 nor more than 3 per cent of moisture when finished.

7. **Acidity.**—The grease must not attack a sheet of polished copper within a period of 48 hours.

8. **Ash.**—The ash shall not be greater than 2 per cent.

9. **Heat Test.**—Two ounces of the grease shall be heated to 212 deg. Fahr., or until the entire mass becomes liquid, and then allowed to cool. The soaps must not separate from the oils during this test and the grease must return to its original consistency.

10. **Fillers.**—The grease must contain no fillers such as resin, resinous oils, soapstone, wax, talc, powdered mica, lampblack, sulphur, clay, asbestos or any other filler or artificial thickening.

#### SLUSHING OIL.

##### General.

1.—This specification covers the requirements of the Army for a very adhesive, heavy-bodied, straight mineral oil, which must be suitable in every way for the following uses:

For the lubrication and protection of chains, wire ropes and gears of cranes, dredges, steam shovels and all other heavy equipment.

For the lubrication and protection of the gears and ropes of balloon hoists.

For swabbing the wires and cables of airplanes and seaplanes.

For slushing and protecting the bright and exposed metal parts of guns, machines and automobiles during storage or overseas shipment. When used for this purpose the lubricant shall be mixed with an equal amount of kerosene so that it may be applied with a brush.

2. Kerosene may be used to remove this lubricant from the equipment.

##### Physical Properties and Tests.

3. The quality of the lubricant must be equal to or better than that of a standard sample of No. 1 wire rope lubricant, sample of which will be furnished by the Chief of Ordnance, Washington, D. C.

4. The lubricant must be a petroleum product only, free from vegetable or animal oils or products, or residues or fats of any kind. It must be entirely free from fillers such as talc, resin, tar and all materials of every nature not related to the original product.

5. **Viscosity.**—The viscosity must be within the following limits when the lubricant is tested in a Saybolt Universal Viscosimeter, at 212 deg. Fahr., 900 seconds to 1,100 seconds.

6. **Adhesiveness.**—The adhesiveness of the

## Government Maps Air Routes

### Five Planes Return to Langley Field After Covering South—Others Out

WASHINGTON, Dec. 23—Five 2-seated training planes have just returned to Langley Field, Va., after having mapped out a course along the Eastern slope of the Appalachian range to Columbia, S. C., to link into the Southern trans-continental air route now being charted by squadrons of planes working both East and West from fields South of the Ohio River. The total flying time of these planes from Langley Field South to Columbia was 5 hr. and 2 min. The distance in an air line between the two points is roughly 330 miles. Columbia, S. C., is 225 miles from Souther Field, Americus, Ga., and planes flying from Souther Field North have already mapped this course. The course from Washington, D. C., to Langley Field, Hampton, has also been charted. Therefore when the planes flying from the West have reached Americus, Ga., one trans-continental air route will have been charted and ready for flight from Washington, D. C., to the Pacific Coast.

Good landing fields were found at Suffolk, Va., Franklin, Va., Pinehurst, N. C., Camden, S. C., and Columbia, S. C. The pilots reported that the terrain between Franklin and Raleigh was such that no possible sites could be located.

### Four Army Planes Reach Atlantic Coast

WASHINGTON, Dec. 23—The squadron of four Army training planes flying from San Diego has reached the Atlantic coast. This flight in formation approximates 2400 miles. The planes left the Pacific Coast Dec. 4 and they have come East across the continent in short flights limited by the size of their gasoline tanks, none of the planes carrying more

lubricant is one of its most essential qualities. As there is no satisfactory laboratory method for the determination of this quality, the adhesiveness will be determined by applying the lubricant to a set of gears operating under practical conditions, and comparing the effect produced with that produced by a standard sample of No. 1 wire rope lubricant mentioned above under the same conditions.

7.—**Corrosion Test.**—When applied to a plate of polished steel the lubricant must protect the steel for a period of thirty days from chemical vapors, from the action of salt or fresh water and from the action of water containing from 10 to 25 per cent of sulphuric acid. For the purposes of these tests the water and solutions shall be held at a temperature of 60 deg. Fahr.

##### Drying Test.

8. When the lubricant is applied to a wire rope that has not been oiled with any other material, it must not crack, peel or chip after exposure to low atmospheric temperatures for sixty days.

9. When applied hot to the outside of a one-inch wire rope that has not been oiled with any other material, the lubricant must penetrate to, and be absorbed by, the fiber core, and at the end of sixty days, when the rope is put under strain, the oil must be forced out of the core between the wires of the strand.

than an hour and a half's supply at any one time.

The crews, two men to a plane, have gathered data and statistics on landing fields, also made air maps of the route along which they came.

This work is a part of the big reconnaissance now being made by fliers going out in all directions from over 25 fields in various parts of the country.

The material collected, as fast as it is returned to the fields, is being forwarded to Washington for analysis and compiling in the form of a Government air guide or blue book.

Major Albert D. Smith, commanding the air squadron which has come East from the Pacific, reported to-day to the Division of Military Aeronautics in Washington, D. C., that his planes left Americus, Ga., at 9 a. m., Dec. 22, and arrived at Jacksonville, Fla., at noon, having encountered rain and fog all the way and at no time having a ceiling of more than 500 ft. Major Smith expects to fly his squadron to Washington at an early date.

### Cleveland-Chicago Air Mail Postponed

WASHINGTON, Dec. 23—The Post Office Department has suspended the operation of the New York-Cleveland-Chicago air mail route until Jan. 2. Airplanes in the service will be taken apart and reassembled to insure better success when the next attempts are made. The Post Office Department states that the airplanes used in the experiments which resulted in failure last week were hastily assembled and that this caused the mishaps.

### Wisconsin Has 32,013 Vehicles

MILWAUKEE, Dec. 23—Wisconsin absorbed 32,013 passenger and commercial cars during 1918, according to the final registration figures for the year given out to-day by A. J. Cobban, head of the motor registry division of the secretary of state's office in Madison. The total number of licenses issued to private owners is 196,844, of which 189,983 were for passenger cars, and 6861 for commercial vehicles. In 1917 the combined registry was 164,531.

### New York Packard Export Office

NEW YORK, Dec. 21—The Packard Motor Car Co. has opened an export office in New York under the supervision of Fred Cardway. The company now has dealers in nineteen foreign countries, including Hawaii, the Philippines and Porto Rico.

### Schloemer Becomes Royal

OSHKOSH, WIS., Dec. 23—The Schloemer Mfg. Co., 388 Division Street, Oshkosh, Wis., operating a foundry, welding, plating and metal specialty plant, has been reorganized as the Royal Mfg. & Foundry Co., incorporated with a capital stock of \$30,000. The officers of the new company are: President, Frank C. Clark; vice-president and general manager, Robert P. Hainsworth; secretary-treasurer, Peter J. Schloemer.

## Contracts Placed \*

WASHINGTON, Dec. 23—The following contracts were placed by the Motors Division, Quartermaster Department, since the signing of the armistice, and have been approved by the Board of Review:

Nov. 27, 1918

Ford Motor Co., Detroit, 600 new style ambulances, \$420,348.  
Ford Motor Co., Detroit, 500 Model "T" cars, \$208,830.  
Ford Motor Co., Detroit, 500 Model "T" cars, \$220,008.  
Ford Motor Co., Detroit, 500 Model "T" cars, \$208,830.  
Ford Motor Co., Detroit, 500 Model "T" cars, \$223,200.  
Ford Motor Co., Detroit, 500 Model "T" cars, \$249,055.  
Ford Motor Co., Detroit, 5000 Model "T" cars, \$2,542,100.  
Ford Motor Co., Detroit, 50 ambulances, \$34,616.94.  
Ford Motor Co., Detroit, 136 ambulances, \$75,953.28.

Nov. 26, 1918

Swinehart Tire & Rubber Co., Akron, 100 casings, \$23,421.50.  
American Chain Co., Bridgeport, 100 skid chains and 30,000 cross chains, \$15,750.  
Federal Rubber Co., Cudahy, Wis., 5250 ft. 2-in. I. D. 3-ply radiator hose, 4125 ft. 1 1/2-in., \$1,792.50.  
B. F. Goodrich Rubber Co., Akron, 11,995 casings, \$252,784.55.  
B. F. Goodrich Rubber Co., Akron, 7015 casings, \$57,172.25.  
United States Tire Co., New York, 14,025 casings, \$114,303.75.  
Goodyear Tire & Rubber Co., Akron, 7675 casings, \$80,587.50.  
Fisk Rubber Co., Washington, 7070 casings, \$74,235.  
United States Tire Co., New York, 6180 casings 30 x 3 1/2 nonskid clincher, \$64,680.  
Kelly-Springfield Tire Co., Akron, 10,000 casings 30 x 3 1/2 nonskid clincher, \$105,000.  
Fisk Rubber Co., Washington, 1156 36 x 6 cord casings, \$63,695.50.  
Kelly-Springfield Tire Co., Cleveland, 1218 36 x 6 casings, \$67,111.80.  
Kelly-Springfield Tire Co., Cleveland, 578 36 x 6 cord casings, \$31,847.80.  
B. F. Goodrich Co., Akron, tubes, \$26,725.40.  
Fisk Tire & Rubber Co., Washington, 5650 30 x 3 1/2 clincher casings, \$59,325.  
Pennsylvania Rubber Co., Jeannette, 1500 30 x 3 CNS fabric casings, 4500 30 x 3 CNS fabric casings, 250 31 x 4 CNS fabric casings, \$64,220.  
Goodyear Tire & Rubber Co., Washington, 16,500 casings, \$134,475.  
United States Tire Co., New York, 2312 36 x 6 casings, \$127,160.  
Firestone Tire & Rubber Co., Washington, 8000 30 x 3 1/2 casings, \$84,000.  
Kelly-Springfield Tire Co., Washington, 3000 casings, \$31,500.  
The United States Tire Co., New York, 2000 casings, \$43,780.  
United States Tire Co., New York, 14,850 tires as per list, \$253,218.50.  
Swinehart Tire & Rubber Co., Akron, solid pressed-on tires, \$113,759.10.

## Navy Building Transatlantic Seaplane

WASHINGTON, D. C., Dec. 21—The United States Navy is constructing a hydroplane to be equipped with three Liberty engines and capable of carrying 45 passengers, which will be used for a test flight across the Atlantic Ocean, according to reports here. The plane is being built at Rockaway, N. Y. The machine will probably carry three or four occupants when it attempts the transatlantic flight.

## Government to Distribute Surplus Army Stocks

WASHINGTON, Dec. 21—A Surplus Property Division with an office in the Munitions Building will have charge of the disposition of all stocks of commodities and materials which have been purchased for the Army and are in excess of the requirements. No list of the surplus material is as yet available. It will be the policy to dispose of such surplus in so far as is possible to other Government agencies. For example motor trucks and airplanes will be diverted to the Post Office to the largest possible degree. A considerable portion of the balance, it is expected, will be required for export by relief organizations in Belgium and Russia and other countries. Such balance as remains will be distributed in the town market, always in such a manner as to cause the least disturbance. Offers will be first made to manufacturers so that they may purchase and re-sell if desired. Whatever surplus remains will be offered for public sale by advertising and bidding, at auction or in whatever other manner may be later determined.

## Permit Exports to Holland

WASHINGTON, Dec. 21—The War Trade Board will now consider applications for the exportation of all commodities to European Holland. All shipments must be consigned directly to and only to the Netherlands Overseas Trust, and licenses will be valid only for shipment on vessels flying the Dutch flag. Under new rules for exporters shipping to Holland the War Trade Board procedure includes that the exporters must obtain advice from the prospective Holland importer that an import certificate covering the proposed consignment has been issued by the Netherlands Overseas Trust. The exporter must secure the number of this certificate and specify it on his license application blanks.

## Lipsner Lodges Charges

WASHINGTON, Dec. 20—B. B. Lipsner, formerly Chief of the Aerial Mail Service, filed charges against the Post Office management of the service in a letter to Senator Sherman. The letter was presented to the Senate yesterday. Lipsner charges that Otto Praeger, Second Assistant Postmaster General, told him that Postmaster General Burleson was financially interested in the Glenn-Martin Aeroplane Co. He charged that the department is spending millions of dollars in constructing special planes instead of utilizing the planes turned over by the War Department. The charge is made that incompetent men have been placed in charge of the Aerial Mail Service. J. B. Corriden, the new supervisor of the Aerial Mail Service, states Lipsner, has had absolutely no aircraft experience. Dr. L. J. Busslar "from a \$1,600-a-year follow up clerk in my office," says the letter, "has been made Chief of the Section of Maintenance. He is not an engineer. J. Clarke Edgerton, son of the purchasing agent of the Post Office Department and formerly an aviation lieutenant in the Army, has been made Chief of the Section on Flying, which includes testing, experiments and control of flying. He is only 21 years old. For Aerial Mail Division interests two postal clerks have been named."

When told about the letter, Postmaster General Burleson said he did not even know who owned the Glenn-Martin company.

## Bureaus to Assist in Getting Work for Returned Soldiers

WASHINGTON, Dec. 23—Bureaus will be established by the Department of Labor in every community of the country to be known as the Bureaus for Returning Soldiers, Sailors and War Workers, and these will ascertain what employment is open for such individuals. The Bureau will co-operate in each instance with a local U. S. Employment Service. It will afford opportunities for workers to register and will classify them and will maintain such positions open in the community. It will give every possible assistance to every applicant for work. The Bureaus will be organized either through the Community Labor Boards of the Department of Labor, the U. S. Employment Service or in those cases where these bodies are not established the local Council of Defense will create the bureaus.

## Smithsonian Preparing Exhibit

WASHINGTON, Dec. 23—The Smithsonian Institution, United States National Museum, is arranging for a permanent exhibit of the various types of airplanes built in the United States for the War Department during the present war. In addition it is installing a series of airplanes, including the reconnaissance and bombing planes used by the French Government in 1917, and also including the first Government owned airplane built by the Wright Bros.

## Canada May Re-instate Duty on \$1400 Tractor

OTTAWA, Dec. 21—The request of the Canadian Manufacturers' Association, as recently expressed by a resolution passed at Toronto, that the duty on farm tractors be replaced, is causing some interest at the capital. The situation is that the duty has never been really removed, but an order-in-council passed on Feb. 7, 1918, provided for its remission by the Customs Department for a period of one year. In other words, the duty is refunded to importers of farm tractors not exceeding \$1,400 in value. Should no action be taken by the Government prior to Feb. 7, next the duties on imported tractors, as well as the duties on meat, cattle and traction attachments dealt with in the same order-in-council, will again be collectable. Should parliament not meet before February, an extension of the period of remission of duties can be provided for only by a supplementary order-in-council.

### Government Slow in Releasing Plants

DETROIT, Dec. 23—None of the assembly plants of the Ford Motor Car Co. which were taken over by the Government have as yet been released. The factory at Detroit is rapidly getting back to normal production and has practically concluded its war program. The assembly factories, while they have discontinued their work, are still held by the government.

### Ward Will Manage King

DETROIT, Dec. 23—Artemus Ward, Jr., president of the King Motor Car Co., has decided to add the duty of general managership to his office. Benjamin Siegfried, who has had active charge of King affairs for several years, has resigned to take effect Jan. 1. After this time the reins of the King Motor Car Co. will be entirely in the hands of Mr. Ward. Mr. Ward is at the present time building up a new sales organization and intends to get into production about March 1 so as to meet the spring market.

### Reliance Wheel to Start

YOUNGSTOWN, OHIO, Dec. 23—The Reliance Wheel Co. has been organized with a capital stock of \$100,000 to produce a new type of double disk wheel for use on automobiles, trucks, airplanes and tractors. The officers are: president and general manager, Joseph M. Crenan; vice-presidents, T. E. Milliken and A. J. Engel; treasurer, A. A. Aull.

### Harry W. Ford

DETROIT, Dec. 23—Harry W. Ford, prominent in Michigan automobile circles, and organizer of the Saxon Motor Car Corp. and its president and general manager for 4 years, died in New York City last week of pneumonia. He was recently honorably discharged from the army service, after having served in the Motor Transport Corps at Jacksonville, Fla. The late Mr. Ford came to Detroit

from the National Cash Register Co., Dayton, and in 1909 he became advertising manager of the Chalmers Motor Car Co. In 1914 he withdrew from the latter company, of which he was then assistant general manager, and organized the Saxon Motor Car Corp. He was president of the Saxon corporation until about a year ago, when he resigned to enter another line of business.

### Liberty Line Revised

DETROIT, Dec. 15—Although the chassis remains practically as before, the bodies on the Liberty cars have been altered in many minor details by the Liberty Motor Car Co., Detroit. The louvres in the hood have been doubled in number on all the models and a corrugated walnut rim has been placed on the steering wheel instead of the plain walnut rim which was used previously. To make for freer radiation, the front license tag has been placed below the radiator instead of in front of it.

The touring car and roadster are now fitted with an improved windshield in which the upper glass overlaps the lower one, thus doing away with the rubber strip which formerly closed the aperture between the glasses. On these two models the rear curtain light rims are now nickel finish.

The 4-passenger body has been entirely redesigned. It was formerly a chummy or close coupled type and this has been changed to give more room and to make a better looking car. The body is of straight-line design with a bevel edge around the top and there is room for 4 persons and space to spare. The square cornered effect at the rear of the car makes it possible to take advantage of every available inch in building the rear seat and yet keep the body within the proscribed limits. The windshield is set at a slight angle. The door handles are nickel plated.

The Sedan is unlike last year's model in that it has four doors and all windows lower into the body of the doors except the rear, which is stationary. The body has been made more roomy and is equipped with a Perfection heater.

The coupe seats 4 passengers and the driver's seat is just a little forward of the other seat, which, by the way, is 36 in. wide and will accommodate 3 persons. The fourth seat is carried under the cowl when not needed. A dome light provides illumination and a Wilton carpet covers the floor, while the whole interior is finished in gray velour with silk curtains to match, with the exception of the driver's seat and the side of the body at his left, which are finished in leather. Luggage room is provided in the rear deck.

### Springfield Sets Show Dates

SPRINGFIELD, MASS., Dec. 21—Dealers will hold a show in the Municipal Auditorium during the week of Feb. 24. The show committee is composed of Charles R. Culver (Pierce-Arrow), John S. Harrington (Hudson), Frederick Calderwood (Chandler), and Robert M. Sauers (Federal truck).

## Labor Supply Now Equal To Demand

WASHINGTON, Dec. 24—Labor, according to the Department of Labor, now is about equal in supply to demand. Shortages are continuing in New Britain and New London, Conn., and the supply of labor equals the demand in all other sections of New England.

New York City reports a supply equal to the demand with a shortage of common labor and an excess of skilled labor reported in the State. Shortages of labor are found in Pittsburgh, Philadelphia, Harrisburg and other Pennsylvania mining districts. Ohio reports a surplus of 3000 in Toledo, 500 in Cincinnati, and 5000 in Dayton while Akron shows a shortage of 2000 workers. A small shortage is reported in Joliet, Ill., while all other sections of the State report a supply equal to the demand, as does Indiana. Kansas City notes a surplus of 4000 workers. Detroit reports the supply equal to the demand.

The Southern cities, Atlanta, Louisville, Baltimore, Lynchburg and Chattanooga report shortages. New Orleans has a supply equal to the demand and Nashville shows a surplus.

Salt Lake City reports a surplus. Denver and Montana indicate a supply equal to the demand while shortage is reported from Little Rock, Arkansas. The statements from the Pacific Coast indicates a surplus of 7000 workers in San Francisco, 2500 in Oakland, and a like situation in Portland, Oregon, while Los Angeles has a supply equal to the demand.

Reports received from several industries indicate that more workers will be taken on than released during the coming week. The iron and steel industry report from 1072 employers and employing 802,600 workers last week will be using about 799,794 by Dec. 28. The textile industry report from 731 employing 236,207 workers will take on 28,000 additional workers this week.

### To Help Soldiers Get Jobs

WASHINGTON, Dec. 15—The United States Employment Service, Department of Labor, has instructed its State directors to set in motion machinery for immediate establishment of employment bureaus for the use of soldiers, returned and demobilized. These organizations will ask the assistance of all industrial bodies in their community.

### Wood Reports on Stocks of Fuel and Lubricants

WASHINGTON, Dec. 10—Stocks of oil on hand needed for use by the Army according to Brig. Gen. R. E. Wood, Acting Quartermaster General, in depots and camps of the United States or on board ship in transit to France, as of Nov. 1, include 978,579 gals. of aviation gasoline, 2,525,205 gals. of motor gasoline, 240,472 gals. of fighting naphtha, 256,155 gals. of kerosene and 1,075,007 gals. of lubricating oil. There are also 594,559 gals. of fuel oil and 254,117 lb. of grease in the United States.

## Truck Reliability is in the Bearings

A satisfactory truck cannot be better than its bearings.

In Gurney Bearings the utmost of capacity is embodied in the one simple bearing. The maximum in the number and size of balls is used, due to the patented method of assembling. The maximum of capacity per ball is realized by virtue of close and highly perfect race contour. Both radial and thrust loads are carried on a single row of balls. Thus simpler, more compact bearings are possible.

In these fundamental facts lies the peculiar fitness of the Gurney Ball Bearings for motor truck construction.

**TRUCK & TRACTOR MANUFACTURERS**

HARVEY, NOV 12 1918.

U. S. A. AND ELSEWHERE

AMERICAN INDUSTRIES WERE JUST GETTING WELL STARTED IN "WIN-THE-WAR" WORK WHEN WE HEARD THE GLORIOUS NEWS OF THE ARMISTICE AND APPROACHING PEACE. DURING THE WAR BOTH TRUCKS AND TRACTORS STRIKINGLY PROVED THEIR HIGH ECONOMIC WORTH. AFTER THE WAR FOOD AND TRANSPORTATION WILL STILL BE VITAL PROBLEMS AND A GREAT MARKET FOR ALL WORTHY TYPES OF TRUCKS AND TRACTORS SEEMS AMPLY ASSURED. WE ARE FORTUNATE IN HAVING CONTINUED TO INCREASE FACILITIES FOR THE PRODUCTION OF OUR STANDARD ENGINES WHICH HAVE BEEN USED FOR VARIOUS WAR PURPOSES. WE SHALL THEREFORE BE ABLE WITHOUT WAITING FOR READJUSTMENTS TO CARE FOR INCREASED DEMAND FOR "BUDA ENGINES-HIGH CLASS" FROM OUR OLD AS WELL AS NEW CUSTOMERS.

THE BUDA COMPANY

**P**ERHAPS it is hardly the function of the publisher to offer his Christmas greetings to you, but the particular conditions and the season have gripped us—more than usual.

There is so much really inspiring work in front of us—as industrial leaders, designers, constructors—as men and as citizens that we cannot avoid congratulating you on the certainty of a happy Christmas over the peace so recently acquired and an inspiring New Year in the making of peace a permanent industrial service.

Merry with a deeper merriment be your Christmas, happy with a greater inspiration your New Year.

**Mr. Engineer! Mr. Purchasing Agent! Mr. Auto Builder!**

**When you want fans without bearing troubles, specify**

# The SCHATZ "UNIVERSAL" Annular Ball Bearings

*Note the simplicity of this assembly. The "Universal" has equal thrust capacity in either direction; consequently bearing assembly can be made either way.*

Ample thrust capacity without excessive stresses, because of the angular ball contact lines.

Ample radial capacity because of the maximum number of large balls and the absence of notches or other race malformation.

Fool-proof, non-adjustable, self-contained—not at the mercy of a monkey-wrench.

Silent, reliable, long-lived anti-friction bearings.

Uniformly high quality.

## The Limit System Motor Car

**A** SURVEY of the industry soon brings out the great big fact that practically all of the cars that continue year after year in the public's favor are the cars that are **manufactured**, not **built**. By "manufactured" we mean—produced in large quantities on a strictly interchangeable basis. In other words, manufactured in accordance with the Limit System.

To maintain a Limit System requires limit gages.

To maintain limit gages requires a thoroughly dependable **STANDARD**.

When a shop has such a standard, it can keep the various shop sizes under its control—and this is one of the most important things in modern manufacturing. When a shop has control of shop sizes, there is **GO-TOGETHER-FIRST-TIME** in the assembling department. And more important

than this, there is **GO-TOGETHER-FIRST-TIME** of spare parts when the car-owner has to make replacements.

Johansson Combination Gage Blocks are in use by practically all of the big car makers and parts makers. Naturally, there are some exceptions, but they are rapidly disappearing.

Certain it is, no car of the future can be built on the old cut-and-try, "absolute dimension" basis and become a "big car" from a popularity standpoint.

It's the car that gives the motorist the longest ride for his money that continues in the public favor. And this means the Limit System Car.

Johansson Gages are covered thoroughly in our new gage catalog. This catalog is sent free upon request.

## A Thoroughly Satisfactory Clutch For Heavy Truck Work

THE clutch shown below, has proved to be probably the most satisfactory clutch in use today on heavy motor trucks.

It is the result of the combined efforts of some of the best engineers in the industry, and represents, we believe, the final word in clutch construction.

With possibly slight changes to fit your layout it will solve your clutch problems finally and satisfactorily.

*Detlaff Clutches are furnished  
either as a separate unit or  
complete with controls.*

## For Passenger Cars and Light Trucks There's a Detlaff Clutch, Too

The lighter models of Detlaff Clutches have proved as satisfactory for use with smaller motors, either in trucks or passenger cars.

Each is distinguished for its easy action and freedom from slipping and consequent wear—*A Velvet Clutch With the Bull-Dog Grip.*

### Special Designs for Your Needs

We will gladly work with you on special designs of clutches and controls, either together or separate units, for quantity production.

Our extensive facilities, including both foundries and machine and assembly plants, devoted exclusively to clutches and controls, insure low production costs and prompt, dependable deliveries.

Let us figure with you on these parts.

**PHILBRIN**  
*Reliable*  
**IGNITION**

*Until They Saw With Their Own Eyes They Refused to Believe!*

**B**UT when the test was over the French Commission specified PHILBRIN, after witnessing a performance marked by a pronounced increase in power and flexibility and a startling economy of gasoline.

The Baldwin Locomotive Works had long before learned, through rigorous comparative tests, that only Philbrin Ignition would enable their big gasoline engines to deliver 100% satisfaction. Uncle Sam had been using their engines behind the battle lines of France and Belgium with extraordinary success.

Yet when France came to America for gasoline locomotives the French Commission questioned the practicability of battery ignition.

And until they saw with their own eyes they

would not believe that any one system of ignition would possibly reveal such a capacity for increasing engine power, flexibility and gasoline economy. *But it did.*

The problem was to produce complete combustion, greatly reduce gasoline consumption, insure easy starting and simultaneously to fire two spark plugs in each of 6 huge cylinders in their firing order. This is a characteristic example of the many ignition difficulties which Philbrin Systems are repeatedly being called upon to solve.

Philbrin Ignition is being used on and is obtainable for Airplanes, Tractors, Trucks, Passenger Cars and Marine Engines of any number of cylinders, of either low or high compression.

# Hess-Bright Ball Bearings

## *Ready for the duty asked—*

It's hard, when you see a squadron of planes at rest, to picture them as a mechanical device that has overcome the Law of Gravity. For they are heavier than air. And if you hold a Hess-Bright Ball Bearing in your hands it is equally as hard to picture it as an ingenious device that has all but mastered friction. For it is simply a rugged collar of steel encircling a set of true spheres of steel. And it is so small compared to other important parts

in plane and engine construction. But there are none that are more important. Speed, climbing power, control, engine action—all are dependent on bearing performance. Twenty-six places exist where Hess-Bright Ball Bearings will help to build air supremacy. That's why makers of planes buy the best. For while the Hess-Bright first cost is more, in the long run it is the least expensive. And it has been by the performance it gives that its reputation has been established.

# DISTINCTIVE APPEARANCE

## *An Added Asset*

THIS TRADE-MARK

Now that the automobile industry is entering a production period that promises the keenest competition in its history, manufacturers are more concerned than ever before regarding Protective Finishes. They demand not only Wear, but the added asset of Distinctive Appearance.

Properly selected finishing materials and correct methods of applying them are a guarantee that the finish on your product will retain its attractive appearance under hard usage.

For example, take the Baked Finish as shown on the Black Japanned Hoods and Fenders of most automobiles—these parts retain their lustre and smoothness long after the finish on the average body is dimmed and cracked.

*Look Into Our Baking Finishes.*

goods can be baked at temperatures up to  
500° F.*

# "The Right Timken or None"

## A Fundamental Policy of Timken Engineering

To the owner of a tractor, truck or motor car, one Timken Bearing looks very much like another, except in size, for all have the same basic principles of design.

Furthermore all Timken Bearings are of absolutely the same quality, made of the same Timken-made steel, machined, carbonized, heat treated, ground, inspected, tested, and assembled in exactly the same way.

Yet there is a sufficient difference between the bearings on the front axle spindle of your car and the ones at the corresponding point in any other model—even of the same make—to receive careful study by the best engineering brains Timken can devote to it.

Past experience, of course, makes each new installation easier, and the difference between two vehicles is sometimes very slight.

But the all-important fact remains that Timken takes nothing for granted.

It may be only a little variation in the taper or length of a roller, in the

thickness of a cone or a cup, but Timken engineering insists that there can be only one correct Timken Bearing—out of all possible variations—for any particular place in any particular make and model of tractor, truck or motor car.

Therefore every detail in the specifications which can affect the operation of the bearings is given thorough consideration by Timken engineers and discussed in conference with the engineers of the car-builder, axle-builder, or transmission-builder, as the case may be.

These progressive manufacturers not only welcome, but urgently request this co-operation, because they realize how valuable to their customers is the highly specialized experience of Timken engineers, in working out thousands of bearing installations in every past and present type and size of automotive vehicle.

However, if some one manufacturer should prove the rare exception and insist on bearings not suited to his car, because of price or

any other consideration, Timken will, as has been the case on past occasions, pass up this business, whatever it might mean in profit.

*Timken engineering goes beyond the point of insisting on the proper bearings. It also insists on correct mounting of those bearings.*

For the design and construction of the supporting parts, the accuracy with which a cup is pressed into a hub or a cone fitted upon a shaft may affect the future satisfaction of the owner.

The remarkable record of Timken Bearings in service is due to three equally important factors:

1. Fundamentally correct principles of design, applicable to any installation in any type of motor vehicle.
2. Adequate manufacturing experience and equipment, even to the making of the steel itself.
3. Insistence upon proper selection and correct mounting of the one proper bearing for every installation.

# SHELDON

## PRECISION MEANS SAFETY

Where "short cuts" mean risk, Sheldon takes the longest way around, rather than accept the the doubtful benefits of quicker methods.

It might, for example, be easier—and cheaper—to build a welded steering knuckle. But your truck, its load and its driver are staked against the strength and efficiency of this little part. So Sheldon *drop forges* every steering knuckle in *one piece*, from chrome nickel steel. Then, to

guard against friction and give lasting assurance of absolute safety, it is ground to size within micrometer limits.

This way of doing even the little things naturally makes Sheldon Axles somewhat higher in price than the average. But you don't mind paying a little more to start with, when you get such ever-lastingly economical service as every Sheldon-equipped truck is sure to give.

When you recommend Thermoid Brake Lining to your customers your recommendation is backed by the endorsement of 51 of the leading automobile engineers of the country. They have selected Thermoid for their cars only after the most exacting tests.

**Where Thermoid is used**

Notice the varied types of cars in which Thermoid is used. High priced heavy cars where service—not cost—is the prime consideration. Lower priced popular cars whose makers are willing to pay a little extra for brake lining that gives the maximum safety. It is also used on the leading axles. The engineers designing these axles are particularly well qualified to weigh the merits of brake lining.

**Why Thermoid was selected**

There are three reasons why Thermoid has been selected by this critical body of competent judges.

1—Over 40% more material and 60% more labor are used in Thermoid than in any woven brake lining. This gives longer wear.

2—Thermoid Brake Lining is Grapnalized, an exclusive process which resists moisture, oil and gasoline.

3—Thermoid is hydraulic compressed. It wears down slowly and can be used until it is cardboard thin.

Thermoid is recommended by these engineers for use on new cars because it gives dependable service and helps to build good will for their products. It should be recommended by you for relining jobs because it will help to build good will for you. Write today for information.

# Don't Let the Winter Storms Tie Up Your Shipping Schedules!

UNCLE SAM has granted Letters Patent on Kissel's ALL-YEAR Cab because—"it is highly desirable to have a motor truck cab that fully protects drivers during the cold, wet months, enabling them to keep their trucks in continuous service during the winter."

This winter, of all winters, calls for not only *continuous* but *increased* transportation. Maintaining schedules and meeting shipping dates *in time* and *on time* are essential.

Kissel's weather-proof ALL-YEAR Cab increases the personal efficiency of motor truck drivers by giving full protection in wet and stormy weather—removes the necessity of lay-ups on account of rain or snow storms—discourages speeding to get under cover—diminishes possibilities of accidents and excessive wear and tear—insures competent handling

and care of trucks by attracting high class operators—keeps trucks in operation the year 'round regardless of weather.

The ALL-YEAR Cab is exclusive with Kissel Trucks. As a step to insure transportation certainty this winter—see your nearest Kissel Truck dealer.

**Kissel Motor Car Co.**  
Hartford, Wisconsin, U. S. A.

With the removal of the winter attachments—windshield, door, side and rear windows—the ALL-YEAR Cab becomes a cool summer cab.

**JENKINS VULCAN SPRING CO. RICHMOND INDIANA**

AN OUTLINE OF THE  
**STATISTICAL NUMBER**  
January 16th, 1919  
**"AUTOMOTIVE INDUSTRIES"**

The changes which have been effected in the automotive field by the war, and the new outlook for reconstruction, suggest the necessity for a comprehensive survey of the conditions and tendencies.

Just now such a survey will perform a service of particular value, presenting the picture of developments in peaceful times and changes from war's necessities.

The estimate of future necessities must be based upon survey and analysis of past performances and present conditions.

It is this important summary which will be presented in "AUTOMOTIVE INDUSTRIES" January 16, 1919.

The outline given is, of necessity, a mere skeleton of what the actual publication will contain. It is offered as an indication of its scope and character and not as a measure of its extent.

It will take up

**FARM TRACTORS**

Production, general, by years and by units.

Usage, in different states and under different conditions.

Market, as indicated by the agricultural requirements, in detail.

The types of tractors and their development.

Export conditions.

**MOTOR TRUCKS**

Production, general, by years and in other details.

Use and possibilities, by states, by capacity and by industries.

Export conditions.

Specifications showing types and developments.

**AUTOMOBILES**

Production, by years, by states and general.  
Use, by states.

Export conditions.  
Types and developments.

Airplanes and motorcycles will be similarly dealt with

Fuel statistics will be given, showing the trend of production and use.

Metal statistics will indicate the trend of prices and the production tendencies.

Standardization will be thoroughly analyzed.

Many other matters will be considered and analyzed in comprehensive detail, but sufficient has been stated to show the important character of this survey and its value as a study and reference to the automotive industry.

It is hardly necessary to refer to the position of "AUTOMOTIVE INDUSTRIES" and its authority in the field.

It numbers among its subscribers the important men in all branches of the field, its pages are read thoroughly by the industrial leaders and the copies are filed in the libraries of its subscribers.

Edited for the industry, it is read by the majority of the men who control the production of automotive apparatus, etc.

It numbers among its subscribers a small but influential group of large distributors of automotive apparatus, a number of executives in allied industries and an effective audience of foreign manufacturers and importers of automotive apparatus in the various countries of the world.

Your advertisement in this issue will be read by the buyers who control the large expenditures in the automotive field.

Copy should reach us promptly, and preferably of a kind suitable to the character of this issue.

# Columbia Axle

## The Height of Successful Axles

Scientific production facilities, vast resources, standardized systems and highly specialized methods are factors that contribute to our success in supplying passenger car axles of highest quality without excessive cost.

The manufacturing advantages

which we enjoy largely offset the greater cost of exceptional materials and workmanship.

There are distinct benefits accruing to the user of Columbia axles that warrants your investigation.

May we be privileged to go into this matter with you?

**The Columbia Axle Company**  
Cleveland, Ohio

## U. S. Government Approval

AT the very beginning of the war the British Government selected the Four Wheel Drive Truck for the heaviest duty to be performed at the front. The U. S. Government selected the same truck (after thorough test) for use over the rough desert trails near the Mexican border. Later, when we entered the World War, the U. S. War Department adopted the F. W. D. as the standard truck for heavy Ordnance Transport.

The Evans Model "Hele"-Shaw Clutch, and the Evans Alignment Joint, are, and have always been, Standard Equipment on the F. W. D. Truck.

The 3-ton Artillery Tractors selected by the U. S. Standardization Board after exhaustive, rigid tests, and "Standardized" by that Board for U. S. Army use, specify exclusively the "Evans" Model "Hele"-Shaw Clutch.

## Evans Model "Hele"-Shaw Clutch (Patented)

The "Armored" Gasoline Locomotives furnished to the Government in large quantities by the Baldwin Locomotive Works and the George D. Whitcomb Co., are equipped exclusively with "Evans" Model "Hele"-Shaw Clutches.

The "Evans" Model "Hele"-Shaw Clutches, and Evans Alignment Joints, are also exclusively used in the Motor Spraying Apparatus used by the U. S. Department of Agriculture.

The principle of the V-groove or V-shaped Disc as shown in cut is unanimously recognised by leading automotive en-

gineers as far superior to any other type and is the chief reason for the remarkable efficiency of the "Hele"-Shaw Clutch.

It would be well to call upon any of our offices for estimates on your Clutch and Joint requirements. Our Illustrated Clutch Catalog is free for the asking.

"Evans" Universal Joints continue to be largely used for general motor power work. The "M & E" Ratchet Top Grease Cups are produced and furnished in enormous quantities to a host of truck makers.

Important! Mark Your Inquiry for Department No. 3

# WIDNEY RESILIOMETER

## A TEST

**PATENTS PENDING**

**In the Hands of Your Laboratory Experts  
enables you to determine for the First time  
a Standard for Compressible Materials**

**Felt—Rubber—Leather—Paper—Cork—Textiles**

The Widney RESILIOMETER has been accepted by all the leading Scientists and Engineers as the only accurate means of determining the Normal Thickness, Hardness, Hysteresis and Resilience of any Compressible Material.

It is the first and only precision instrument that determines these ALL-IMPORTANT mechanical qualities with absolute accuracy in a manner that is instantly understood. NORMAL THICKNESS is measured by a micrometer exerting a standard pressure on a given standard surface. The action of the material under successive increments of load determines the HARDNESS. The return of the material toward its original condition under decreasing decrements of load determines HYSTERESIS and RESILIENCE, all of which can be quickly and intelligibly graphed—see typical graph herewith. This instrument is INDISPENSABLE in the intelligent selection, purchase, and use of Compressed Materials. Send us your samples and let our engineering and laboratory experts submit to you a comprehensive graph which will enable you to KNOW, for the first time, whether or not you are using the most suitable material for the purpose.

**Moltrup Steel Products Co.,** Beaver Falls, Pa.

### Steel for Service

A gear breakdown always means a new gear secured from the storeroom or from the manufacturer, and a loss of time while the machine is idle.

Many manufacturers are using gears made from

### Carnegie Rolled Steel Blanks

because severe industrial use has proven that they wear three to seven times as long as cast steel gears. If properly heat treated they never break.

Protect your gears against breakdowns.
